DECEMBER 4, 1925

LAYMEN AND THE NEW ARCHITECTURE

HISTORY proves that there have been periodic cycles of art movements in the past, but the causes or influences are not so easily determined. Of recent years there is evidence that some movement is in the architectural world. It may be a reaction; it may be the effect of any number of causes, but the fact remains that it is a sign in our social development. The number of books written for laymen upon architecture may either be mistaken or the effect of the general movement, but whichever way we look at it, we can safely say that no opportunities of educating the public have been neglected by those who are called to teach.

A new book of Mr. Manning Robertson* is addressed directly to the layman, with a view to enlisting his interest, and co-operation in our architectural future." So far as we can see, on the flood tide of an architectural revival, and on that account alone its influence should be great. Many methods of interesting the public in architecture have been suggested from time to time, but as a generalisation we might safely reduce them to two classes of thought. Either we attempt to teach the layman architecture or we rail at the structure of society. The author is interested in the layman in architecture, and win his contention rather than to heap scorn upon him for his lack of efficiency in creating the ugly mass of buildings which is the material side of our civilisation. It is a point which is distinctly flattering to the layman, and this spirit in the author undoubtedly adds to the difficulty of his task.

Throughout all through the book that in attempting to educate the layman in architecture the author loses no opportunity in making it clear that it is an education designed to lead him to employ the services of an architect. Here again we note the author's confidence in the layman:—he does not wish him to appreciate, not to become his own architect. The layman is led by a study of architecture to realise the value of his ignorance, and the inference is that henceforward that his house is designed and built by an architect. The author is quite frankly that we are a little sceptical about the results, but any method of raising the standard of architecture is to be commended. We may regard decent architecture as a social duty; nevertheless, we realise that a working knowledge of good architecture must lead to a fuller enjoyment of it.

Observations seem to us to be necessary, in face of the warning that the architectural profession is anxious to have State registration. Whether this will simply mean that a man cannot call himself an architect, while buildings continue to be built without architects, we are unable to say. We agree that "State registration would prevent a man from had not an architect's training and qualifications as such," but if the cobbler can still build his own shoe, it is to be seen the safeguard. In the short outline of the registration we seem to detect a distinction without a difference.

on and the New Architecture." By Manning Robertson, F.R.A.S. (London: John Murray.) 12s. net.

It is a fairly safe axiom that a book on architecture will appeal to the architect if it appeals to the layman, although it by no means follows that the layman will appreciate a book which appeals particularly to architects. It is high praise to say that architects will agree, in the main, with the doctrines, theories, and technical questions raised in this book. Here and there some slight gaps appear to us in the philosophical attitude towards architecture and life, but they are matters for pedants to argue upon. The first chapter on "The Four Circles of Receptivity," is a closely-reasoned philosophical paper developing the analogy between music and architecture. From the layman's point of view the value of the philosophy is a little doubtful, and we have a fear that the author runs the risk of confusing the issue at the very beginning. He is in reality upon much safer ground when he comes to close grips with his subject and writes: "If the following chapters appear at times to drop to an everyday level, it is through the author's conviction that architecture cannot play its proper part in the world until it is brought into relationship with everyday people and common needs and is co-ordinated with them." A complaint of a somewhat similar nature might be levelled against the chapter on Gothic architecture in relation to the modern conception of religion. The mediæval association of Gothic architecture with modern theories upon religion is a connotation which is open to question, and is likely to be objected to by some readers. The whole subject is difficult to argue upon, but it is beyond all doubt that everybody does not experience the same reaction from the religious expressions of Classic or Gothic churches. We raise the point merely because we fear that the layman, in the process of absorbing architectural knowledge, may feel he is being tried a little too far.

The author deals with many controversial subjects throughout the book in a robust common-sense manner which we admire, and the point we raise is the one exception where we are inclined to question the inclusion of a subject, even if we are in general agreement with his conclusions. Upon all the many constructional and domestic problems which come under the wide scope of architecture, and upon the various social questions which affect architecture, we find a well-balanced judgment and sound conclusions. As a reformer the author displays precisely those qualities of diplomacy and "practical idealism" which the idealist so often lacks. In many respects, the spate of misdirected and uncontrolled idealism which we have experienced during recent years constitutes one of the great dangers to the country. This book imparts a steadying influence upon so many of these matters which the layman is apt to get out of perspective, and every reader will feel this influence while he is broadening his understanding and conception of architecture.

We close with an elegant extract which in itself is ample justification of the need for this book: "It is melancholy to note that when the inhabitants of a town in these islands discover a district of peculiar beauty in the neighbourhood of a town and decide to build their houses and live there, the first thing they do is to spoil it." The book is well illustrated with photographs, many of them representing architectural forms full of suggestion and power. The author deserves the thanks of the architectural profession for a stimulating work which ought to be read by everyone.

NOTES.

Develop- ment of Oxford.

THE new Mayor of Oxford, the Rev. John Carter, has accepted the help of an advisory committee of architects on the question of the future development of the city. The three architects originally nominated by the President of the R.I.B.A., Mr. Guy Dawber, were Dr. Raymond Unwin, Chief Architect to the Ministry of Health, Mr. Edward Warren, a member of a well-known Oxford family, and Mr. H. S. Rogers, President of the Berks, Bucks and Oxon Society of Architects. The Minister of Health has, however, declined to give permission to Dr. Unwin to serve as he may have to advise on plans that may be submitted by Oxford, and accordingly there has been nominated in his place Mr. F. M. Elgood, F.R.I.B.A., a Past President of the Town-Planning Institute and Housing Commissioner under Dr. Addison at the Ministry of Health. It is expected that the Mayor will accept this nomination.

Royal Commission on Ancient Monuments.

THE report of the Royal Commission on Ancient and Historical Monuments, now issued as a Parliamentary Paper, is full of interest, and gives particulars of the inquiries in regard to ancient monuments in West London, not including Westminster Abbey. Descriptions of the monuments are given, and it is stated that no important monument dating from the earliest

times to the year 1714 has been omitted. One realises how wide is the ground covered when reference is made to buildings in Hampstead and Wandsworth, among the many examples scheduled. The many injuries to ancient buildings during the period of the Gothic Revival has led to a strong reaction, and the desire to preserve those buildings which remain to us is one worthy of all support. We know, however, that the preservation of the old may become something of a fetish, and in the case of ancient glass this is often the case. A too exclusive dwelling on the past tends to depreciation of the present in some minds more prone to archaeological inquiry than creative appreciation, and it may divert us from the

larger issues involved. The free approach in dealing with modern monuments free from the point of view of experience, is as important as preservation of ancient monuments, and this does not always embrace at the time.

Regional Town- Planning: Manchester and District.

THE Manchester district Joint Town Planning Advisory Committee at its fifth annual meeting considered a draft report on a scheme of development for the Region of the Committee. The Advisory Committee is represented by 96 local authorities and the region it covers an area with

Town Hall, Fordwich.

Thesis Design by MR. T. T. WILLS (Fifth-year Student, Liverpool University School of Architecture).

cent to a radius of 15 miles from the centre of the City of Manchester. The approximate population of the region is 90,000 persons, area 1,020 square miles, and assessable value nearly £1,000,000. The report deals in particular with existing and proposed road communications throughout the region, allocation in broad outline of portions of the region for various major uses, such as industrial, residential, and recreational, and of historic interest within the region, mining areas, public utility services, and general notes on town planning.

Statutory Town-Planning Schemes. THE main recommendation of the Advisory Committee, as contained in the report, is that for the purpose of giving effect to statutory town-planning schemes providing for the enforcement of the various proposals carried out of the various proposals of the Committee, the various local authorities concerned should apportion the region into suitable areas and within each such area should themselves establish a Statutory Joint Committee under the Town Planning Act, 1925, and authorise such a Committee to proceed with the preparation of a statutory town-planning scheme to give effect to the proposals of the Advisory Committee. The report, when published, will contain a series of maps, diagrams, &c., illustrating the proposals of the Advisory Committee and main features of the region which is stated to constitute as a whole the most highly developed commercial and industrial area of its size in the country. The report calls attention to the necessity, in the interests of health, industry, and commerce, of the region being developed on co-ordinate lines as suggested by the Advisory Committee, and that all local authorities concerned are urged not to delay in promoting statutory schemes. It is intended that the report on the regional scheme, together with various maps, shall be published in the New Year.

Housing Restrictions. THE present record number of houses built during the year ended September 30 last is raising in official quarters numerous questions affecting the future of municipal and private housing in this country. The total number built during the year was 159,476, of which 85 were built without any subsidy at all. It is hoped, should the rate of progress continue to increase, to bring the Restriction Acts to an end earlier than was expected. Other possibilities are being considered. Is the programme laid down by the Wheatley Act of last year under which it is hoped to build 2,500,000 houses by the year 1935 being carried out? The number of houses built in 1925 was 90,000, but the year ended September 30, 1926, have been built with the State subsidy. Thus it can be seen that the essential condition of the Government proposals for the maintenance of output has been fulfilled.

filled. "Another condition," writes a correspondent, "no doubt skilfully inserted in the Act by the Treasury, has, however, been overlooked. The contributions from the Exchequer are dependent on the cost of the houses being reasonable. But Sir Kingsley Wood stated in the House of Commons last week that the average prices of houses let by local authorities last month were £447 as compared with £436 on June 1, £440 on January 1 last. Approximately it may be estimated that building before the war cost 5d. per cubic foot; that had increased by 1923 to 1s. 3d.; last year to 1s. 4d.; and this autumn in certain districts to 1s. 9d. per cubic foot. There are expert advisers of the Government who declare that if the present subsidies were discontinued, the cost of building would fall by at least the amount that is now being taken out of public funds."

The Lily Maid. THIS interesting figure is one of the recent works by Mr. Gilbert Bayes, and is intended as a garden ornament or fountain. It is executed in glazed

terra-cotta, the flesh portions having a matt surface, the remainder a bright glaze. The hair is blue with warm intervals, the remainder of the colour scheme being in green and blue-green, with the exception of the water lilies, which are white, and a few yellow flowers. The waves at the base are in blue. The height of the figure is 26 inches.

National Housing and Town-Planning Council. WE regret to note that, as a result of a nervous breakdown, Mr. H. R. Aldridge has been obliged to resign the Secretaryship of the National Housing and Town-Planning Council. Mr. Aldridge has done much valuable and disinterested work in connection with the housing and town-planning movement, and it will be widely regretted that his exertions should have been attended by such unhappy consequences to himself. We are sure that our readers will join us in hoping that Mr. Aldridge may be quickly restored to health, and that at some time in the near future he may be able to renew active participation in the work with which his name has become so closely identified.

The Lily Maid. MR. GILBERT BAYES, Sculptor.

GENERAL NEWS

Professional Announcement.

Mr. E. B. Webber, A.R.I.B.A., has changed his address from No. 8 to No. 2, New-square, W.C.1.

Church, Bellingham.

Built at a cost of £10,500, from designs of Sir Charles Nicholson, the Church of St. Dunstan's, Bellingham, was opened recently.

Leicester Electricity Extensions.

The Leicester City Council propose to spend £314,000 on extensions to main services, substations and a new turbo-generator.

Bentley Priory.

Bentley Priory, Stanmore, an historic mansion of seventy bedrooms, has been provisionally sold to the Air Ministry for use as administrative offices.

Proposed Manchester Stadium.

The Town Council propose to erect a modern stadium in Kirkmanhulme-lane. The contractors appointed are Messrs. T. G. Simpson, of London.

Proposed Aberdeen Barracks.

New barracks for the Gordon Highlanders are to be built on a fifty-four acre site near Aberdeen, at a cost of £150,000. There will be accommodation for 800 men.

Welsh University Extensions.

Extensions are to be made to the buildings of the University of South Wales and Monmouthshire, in Cathays Park, at a cost of £150,000. The architect is Mr. W. D. Caröe, of 3, Great College-street, Westminster, S.W. 1.

Proposed Thames Tunnel.

Local authorities on the Thames side are to hold a conference at the House of Commons to consider ways of advancing the proposal for a lower Thames tunnel and a new connecting railway.

Liverpool Smoke Abatement Scheme.

Liverpool Corporation have decided to erect 250 all-electric houses on their Walton Club-moor estate. These will be specially constructed without flues and chimney-pots, and other means of ventilation will be adopted.

Ancient Monuments.

The ninth interim report of the Royal Commission on the Ancient and Historical Monuments and Constructions of England has just been published, price 3s. The Commission recommend a list of monuments in London as "especially worthy of preservation."

A.A.S.T.A. Smoking Concert.

The annual Bohemian Smoking Concert of the Association of Architects', Surveyors' and Technical Assistants was held recently at Carr's Restaurant, Strand, in aid of the Architects' Benevolent Fund. Mr. F. Fiander Etchells

(President of the Association) occupied chair. The talent and versatility of the artistes employed ensured complete success, everyone present spent a very happy and able evening.

Obituary.

We regret to record the death, on November 25, at the age of seventy-seven, of Walter Stuckey Paul, A.R.I.B.A., head firm of Messrs. W. S. Paul & James, architects of Bristol.

COMPETITION NEWS

Competitions Open.

Particulars published in "The Builder."

Blackpool Memorial Clock Tower.

The President of the R.I.B.A. has nominated Mr. E. Bertram Kirby, O.B.E., F.R.I.B.A. assessor in this competition.

A Cathedral of Humanity: Plan.

Thesis Design by MR. T. T. WILLS (Fifth-year Student, Liverpool University School of Architecture).

Thesis Design by MR. T. T. WILLS (Fifth-Year Student, Liverpool University School of Architecture).

CORRESPONDENCE

Architectural Competitions.

SIR,—With regard to the editorial note respecting architectural competitions in last week's issue of your journal, in which you say "we should like further information in reference to the remarks, in the case of the Manchester Competition, given by one of our correspondents in our last issue that the Institute issued a statement that no action could be taken because it would cut at the basis of the competition system," we beg to say that this information emanated from the Institute and that we had every reason to believe that it was authoritative. A. W. S. & K. M. B. Cross.

The Rima Controversy.

SIR,—May I congratulate you on your fair comment in regard to the Rima controversy—which is welcome in the midst of so much that is unfair? I would like also to point out that the whole problem of public monuments ought to come up for public consideration—before a committee and in the form of an inquiry—should the problem be settled by general public taste, by local bodies, or by experts? The way in which commissions are given to artists for public works of art needs revision.

AMELIA DEFRIES.

Moor Park Building Competition.

SIR,—I know nothing about this competition beyond the publication of the "first premiated" house in last week's *Builder*, and as to that I congratulate Mr. P. D. Hepworth on the admirable character of this design, particularly for his educational treatment, which is eminently suitable and artistically restrained. Once I made the mistake of locating the w.c. in a similar position, but in my plan the entrance vestibule was much more airy and capacious. In any case, such a situation is objectionable. A visitor might arrive and perhaps some chance caller not be taken into one of the sitting rooms. The w.c. in use, there is no escape for the user, and the discharge of the flushing adds to this difficulty, which is bound to arise; while, in the absence of a ventilated lobby, which sanitary experts wisely insist on, unavoidable odours must occur. Besides, the by-laws would oblige the use of a ventilated upcast pipe in a conspicuous place near this entrance door and carried up beyond the eaves. The servants' w.c., in this selected plan, is open to the same objection; and upstairs the w.c. door is needlessly conspicuous from the "upper hall." This fault, which is not merely a matter of sentiment, could have been obviated by turning the bath room round about and putting the w.c. by the side of the linen cupboard to the east end, and so keeping the soil drain away from the tradesmen's entrance. I note that the word "Toilet" is written on the ground plan—(although a closet pan is drawn there)—but the rise in the staircase seems inadequate to allow an adult to use compatibly a wash hand-basin as an alternative. Perhaps the trellis of the porch may account for the omission of the window to this "lavatory," and I have no wish to be hypercritical; indeed, my purpose is to point out the first-named detail which my own experience taught me to avoid as detrimental to the family amenities of a comfortable dwelling.

F.R.I.B.A.

Welsh Dam Disaster.

At the resumed inquest, held at Conway, on the eleven victims of the dam disaster at Dolgarrog, evidence was given to show that the burst was due to the escape of water underneath the foundations. After technical evidence had been given on various points, the coroner, addressing the jury, stated that it was clear that, at the point of the breach, there was no foundation. The persons responsible in the first place were the builders of the dam, but the engineers were responsible for seeing that the work was properly done. There had been gross, even criminal, neglect on the part of somebody, but they could not trace who was responsible at this distance of time.

SOCIETIES AND INSTITUTIONS

THE R.I.B.A.

(Henry Jarvis) Ex-Service Scholarships.

IMMEDIATELY after the Armistice the R.I.B.A. Council initiated a scheme for assisting ex-Service men who were students of architecture by the grant of scholarships at the leading schools of architecture. The working of this scheme has now been completed, and the results can be finally estimated. The ex-Service scholars have been drawn from no less than ten schools of architecture in England, Scotland and Wales, thirty-five students have received financial help in obtaining their professional training, and a total sum of £2,500 has been distributed in this way.

The following table contains full particulars of the working of the scheme:—

School.	1920.	1921.	1922.	1923.	1924.	Total No. of Students.
School of Architecture, Architectural Association..	£100	£75	£75	£30	£150	7
School of Architecture, University of Liverpool ..	100	100	75	50	125	6
School of Architecture, University of London ..	—	100	100	100	75	4
School of Architecture, The Victoria University, Manchester ..	50	50	50	50	50	3
Glasgow School of Architecture ..	—	50	50	50	50	3
School of Architecture, Edinburgh College of Art ..	—	50	50	50	50	4
Leeds School of Architecture ..	—	50	—	25	50	3
Robert Gordon's College, Aberdeen ..	—	50	50	50	50	2
The Technical College, Cardiff ..	50	50	50	50	—	2
School of Architecture, University of Cambridge ..	—	50	—	—	—	1

Scholarships at Exempted Schools of Architecture.

We have received from the R.I.B.A. a list of the scholarships available at Exempted Schools of Architecture. Copies of this list may be obtained at the R.I.B.A., 9, Conduit-street, W.

Diploma in Town Planning.

Mr. John Malcolm Dossor, F.R.I.B.A., has passed this Examination, and has been granted an R.I.B.A. Diploma in Town Planning.

BRISTOL SOCIETY OF ARCHITECTS.

At the second sessional meeting of the Bristol Society of Architects, held in the studios of the Royal West of England Academy on November 20, Mr. F. R. Yerbury, Hon. A.R.I.B.A., delivered a lecture on "Modern Architecture in Scandinavia," illustrated with lantern-slides from his own photographs. Mr. R. C. James, F.R.I.B.A., presided. The lecturer showed several views of old buildings in both Denmark and Sweden for the purpose of indicating the general character of the old work, which formed the traditional inspiration for the modern movement in design. He mentioned, on passing to the more modern styles, that Denmark could show some of the best work in Europe. Numerous views of buildings in Copenhagen—including the new police courts completed about two years ago—were shown.

Swedish architecture was treated in a similar way, pictures of some of the exhibits at the Gothenburg Exhibition (1923) being shown. Mr. Yerbury remarked upon the great amount of architectural sculpture to be found in Sweden, and said he thought more attention was paid there to that department than in England. Views were shown of the Town Hall at Stockholm, by Ragnar Ostberg, completed about three years ago, and described by the lecturer as possibly the finest building in the modern architecture of the world.

LEICESTER COLLEGE OF ARTS AND CRAFTS.

The Leicester College of Arts and Crafts is holding an exhibition of students' work in two parts, one in the College, showing general work done during last session, and the other in the City of Leicester Art Gallery, showing work done during the vacation.

The Department of Architecture is represented

by the prize drawings of the Leicestershire Society of Architects, consisting of a set of measured drawings of Weekley Northants, together with some good made on the spot by Mr. J. E. Potter. The same student exhibits his travelling studies, drawings showing evidence of the historical architecture and including excellent sketches of English Gothic work. W. K. J. Harrod shows a set of measured drawings of St. Mary's Home, Leicester, well rendered.

The local prize drawings for design and construction comprise a design for the quarters of a County Territorial Association. This is by Mr. J. E. Potter, the drawings including diagrams and calculations of the construction together with a water-colour perspective. The drawings show the method of cultivating draughtsmanship practised in the Department and some examples of elementary design by first and second year students.

In the Department of Building Crafts some interesting woodwork, particularly cabinet making, a bedstead, music cabinet, and an occasional table in mahogany being examples of good, simple furniture.

The exhibition of vacation work includes a series of sketches of architectural subjects. Mr. J. E. Potter, the travelling student of the Society, who visited Belgium and the Netherlands, shows other architectural sketches of interest. Mr. W. E. Marston.

COLLEGE OF ESTATE MANAGEMENT.

The first of two lectures on "Town Planning" was delivered by Mr. Raymond Dossor, F.R.I.B.A., at the College of Estate Management recently. After describing the aims of the Town-Planning Act, the lecturer dealt at some length with the effect of town-planning schemes upon land values, particular with the effects of the restriction of building density imposed by such schemes. He showed that a high density entails a relatively high cost of roadmaking and sewers, and a considerable loss of frontage at intersections, so that where land was cheap it did not pay even a small landowner to develop with too high a density. The lecturer especially the case when the ground was steeply sloping, for the more open development of the roads to be planned to suit the conditions with a considerable saving in depth of cut. In the case of the large landowner a factor to be borne in mind was that if the land was not high more land would become available from an agricultural to building value, a number of houses required was fixed, and rate of increase of population. His land as a whole would therefore yield a higher income. Where the land was divided into many owners the same was true of the owners collectively, although a few individuals might suffer damage. In respect of land reserved for open spaces, he pointed out that the value was not lost but removed to neighbouring land, which possibly would not be built upon, all if such open spaces had not been reserved, and in any case must benefit by the presence of such spaces.

NORTH STAFFORDSHIRE A.A.

The first of a series of lectures by the architects, inaugurated by the North Staffordshire Architectural Association, has been given in the New Council Chamber, Hanley, by Topham Forrest, F.R.I.B.A., Architect, L.C.C. The subject of his lecture was "Development in the United States of America."

STREET ARCHITECTURE.—X

By V. M. CHRISTY.

MOORGATE AND BEYOND.

THE impression produced by the present Moorgate is that it is a street of experiment. Recently have the name-plates been altered from Moorgate-street to Moorgate, plain and simple, which is the more ancient name, retaining much topographical history. In fact, Moorgate has been street for less than a couple of hundred years. In the mid-eighteenth century it was being planned, and the end of the century saw George Dance, junior, laying out Finsbury-square, where the trim severity of the sides of tall houses is so gracefully tempered by the swinging curves and stucco reliefs of the north side, where Moorgate joins the square. The value of land here when this was a newly-enclosed residential district was very different from what it was in the time of Edward II, when the fen or moorfield stretching from the wall of the city . . . to Fensbury and to Holy Well . . . all letten for four marks the year." In 1415 the blithespirited mayor "caused the wall of the city to be broken towards the said moor, and the postern called Moregate, for the ease of the citizens to walk that way upon causeys towards Iseldon and Hoxton." How fine a day pleasure to 'walk on causeys' over the moor to Islington! Even to-day there is an exhilarating sense of adventure, a feeling of being on a ramble in the country, if, on a sunny day, one passes beyond Moorgate, beckoned by the budding green or the golden fire upon the stretched branches of the trees at the Artillery Company's headquarters. It is strange how much this military building and its surroundings contribute of a garden-like rural touch to this section of the street. It is interesting, because the Artillery ground, which used to be there in the seventeenth-hundreds, was the successor to the "plain field for archers' foot in," made in 1498 in place of "all the lands which had continued time out of mind out of Moregate." In the moor fields there are "tenter-grounds" too, in the old days, the clothworkers stretched their cloth on tenterhooks, not far from Bethlem Hospital. An air of calm detachment from the bustle and rush of the city of to-day is given to the few score yards by the tree-decked barracks, the Wesley's Chapel, with its quiet open space and the iron gates, where the great preacher's benignly surveys the individual passers. Altogether there is a strangely gripping sense of spacious peace and unhurried sweetness, a little bit of what is now the City-road. To return to Finsbury-square and Moorgate proper. In addition to the more decorative features of the square one notices with pleasure the variety of flower forms in the shallow blind arcades in Dance's tall house fronts. Moreover, the attic dormers peep like half-open eyes over the parapet, belying the rigidly unhumorous and stiff lines of formal windows and doors. The large and rather pretentious modern office buildings at the corner of the square are a little pompous, with their domes and pediments and emphatic stonework. But after all there is a sort of compliment in the fact of their compositeness. It is as though they admitted that only exceptional buildings of to-day can compete in dignity with the simple brickwork of the older parts of the square, and there was no room for it but to perform rather emphatically in stone and steel, if the products of the latter part of this century were to stand without shame beside those of their forerunners. The fact that at present these large newcomers are not to occupy the terminal and corner positions in the square prevents any undue sense of aggressive assertiveness among the older occupants. It is, however, deplorable that the only too prevalent lack of co-operation in street frontage has caused a semi-fragmentation of the unity and happy continuity which should be evident in that more "trimmed" street of the eighteenth-century square. Finally, part of the Adamesque external wall here has been repainted at various times in differing tones of colour. It is, there-

fore, only by persevering analysis of form unaided by colour that one can fully appreciate the pleasing grouping and composition of this block, so carefully designed to present a complete and satisfying whole to the eye of the observer. Of course, the alterations to the ground-floor doorways and windows here and there break the complete harmony and regularity; but because the principal binding lines and the features acting as *foci* are chiefly concentrated on the upper the interruptions on the lower are not so tragic as the indiscriminate painting which produces false values.

From Finsbury-pavement Londonwards, in Moorgate, one comes upon more and more evidence of the experimental character of this stretch of highway. There are some fat, florid, overfed buildings, exuding either retrospective or anticipatory prosperity in their cumbrous decoration. Some unobtrusive, dignified stucco fronts stand between the restless "solid" buildings with coarse experimental detail and the emotionless metallic rigidity of somewhat later experiments. One of these large metallic-character buildings is a very successful experiment in mass composition, but fails to achieve pre-eminence owing to its overloading with experimental decorative features. Not far off is another type. No fussiness this time, but a good straightforward block, given distinction by the bold use of long straight lines of balconies with solid, outspoken balusters. An experiment, this, in direct, telling phrases. Then there is a curious experiment in the mingling of columns, gables and domes. In juxtaposition with a turret surmounted by a dome—a remarkable combination in any case—is a gable whose open front displays four stumpy Doric columns with no very obvious mission. A characteristic experiment of 1908 has curved window bays on plan, and some swags hung here and there, but there is nothing assertive or aggressive about it. It is content to stand serenely among the other experiments, quietly contributing its part to the whole, and displaying its date-label with unassuming self-respect. As unlike this and some other buildings as it could well be is a study in straight lines, a long horizontal stretch of building with a slightly raised central feature, a species of semi-attic, giving a satisfying "full-stop" to the whole rather curt statement. It has a well-defined silhouette in spite of the reliance on long low lines instead of curls and bends. Among the other buildings one notices in mass or in detail in this street is one with an experiment in doorways, or rather in apparent doorways; the entrance to two separate parts is combined under one semi-circular porch-like cavity designed in a manner combining formality and freedom. Remarkable for its entrance, too, is the recently erected experiment in the stucco manner in stone, near London-wall. This is one of the most attractive buildings in the street. It has the dignity of the cream-painted shipping offices without their unimaginativeness, and the straightforwardness of the newest things in the metallic manner without their frigid defensiveness. It is a neat little block, discreetly reticent, sparingly adorned, self-possessed. The entrance has an air of inviting and encouraging the coming-in of those concerned with whatever the business destined to occupy the rooms within. Too often an entrance to office premises repels by its over-pompousness or by its meanness. Neither fault is present here. A building which is an antithesis to the dignified unobtrusiveness of this one soars self-consciously above its fellows, flaunting its small-paned casements. It offends not by its existence as an experimental whole, but by its existence here, even in this street of experiment. Others there are which experiment with the variety of appendages which they can muster on their street front—heads, rolls of stone bank notes, coins of many sizes, and fantasies many and various.

Most recent and most important of all experiments in Moorgate is Britannic House. That is a colossal experiment. It is experimental,

both in mass and in detail. The unaccustomed relative values of the parts making up the vertical composition are a trifle puzzling. In examining each story or order as a unit and in relation to the whole, the uppermost of the three main parts is seen to be the most important; the eye, therefore, does not readily accept the fact that it is at the top, with two other stories of equal value to one another below it. One is more accustomed to find, where the principal part of a composition is placed at the top, that it is the upper of two parts, the lower forming a podium or base of distinctly less importance, or of contrasting character. Here the impressive top portion, with its columns and immense windows, seems a trifle "skied," as if standing on the top of another complete composition, rather than upon a base designed to support it. Another unfamiliar feature is the introduction of severe rectangular openings from some of which a profusion of carved flowers and fruit appears to flow. These rectangular openings give a sternness difficult to reconcile with the exuberance of the other details. There is a certain restlessness, too, which is disturbing in connection with the reposeful poise of the main mass. The partially rusticated surface on the portion otherwise flush-jointed is an experiment provocative of a sensation of indecision, where so many divers interests claim attention. In this second stage, where the emphasised joints occur, the eye does not readily find resting places in its tour over the face of the building. The wealth of fine ornament is a reaction against the cold harshness which characterised experiments of a few years ago.

To appreciate fully the real magnificence of this building, it must be studied from the Finsbury Circus side. Here in the quiet and detachment of the oasis, one can offer the unhesitating admiration which cannot be given so readily in Moorgate, where the building is too much on the top of the observer. Here in the Circus, the splendid sweep of the curved front is seen to be skilfully steadied by the detached pylons and the standing figures of the building itself in such a way that, while the building is intimately related to the circus in that it forms one of its arcs, it is yet a complete independent whole. On the Moorgate side, partly perhaps owing to the atmosphere that seems to characterise the street, it is impossible to appraise it at its real value; it is like the other, an experiment.

But, after all, the whole history of architecture is a series of experiments in mingling the ingredients, stone and wood, brick and steel, with the variable needs of the day, and pouring them molten into the mould of the architect's imagination. Moorgate, the street of experiment, is, therefore, a very typical London office street.

Restoration of Durham Castle.

Progress is being made with the scheme of restoration now proceeding at Durham Castle. The plastering has been removed from the windows, disclosing the original stonework; the outer walls and foundations have been strengthened by the insertion of bronze ties; decaying buttresses have been restored; and it is expected that the western wall will soon be firmly fixed upon concrete foundations.

Incorporation of Architects in Scotland.

We have received the Autumn Quarterly Illustrated of the Incorporation of Architects in Scotland, of 15, Rutland-square, Edinburgh. This issue is a thoroughly interesting one. It contains a biographical sketch of Archibald Simpson, of Aberdeen (1790-1847), who is stated as having done more than any other architect to give character and beauty to his native city. A lecture on "Eighteenth-Century Architecture," by Mr. J. A. Gotch, F.S.A., P.-P.R.I.B.A., to the Glasgow Institute of Architects, is reproduced, together with a paper on "Ideals," by John Watson, jr. Other items include an article on the restoration of St. Andrew's Cathedral, "Architecture and General Education," and "The Students' Vista."

ILLUSTRATIONS

London School of Tropical Medicine and Hygiene.

We publish this week illustrations of one of the five invitation designs (that of Mr. Alan E. Munby) for the Rockefeller School of Tropical Medicine, to be erected in Bloomsbury. (It will be remembered that the design of Mr. Morley Horder was accepted.) The building is to occupy the site bounded by Gower, Keppel and Malet-streets. The conditions required 100,000 sq. ft. in rooms above the basement, and the design shown provides 100,814 sq. ft. on the ground and four upper floors, with the main frontage to Keppel-street and entrances to this and the wing blocks. The buildings enclose a court, 132 ft. by 60 ft. 6 in. at least dimension, and are designed with a view to simplicity in construction (the bays running through from street to street), ready circulation by central corridors, and good natural lighting, which is essential for research work. The ground floor is devoted to administration, a large lecture theatre, conference hall, and a small department of epidemiology and vital statistics; the first floor to the main museum, which occupies the whole of the frontage. The department of physics and applied physiology and the library are placed in a quiet and central position. The second floor accommodates a publication bureau and recreation rooms, and the sanitary administration section in the wings, the frontage being occupied by the upper part of the museum. The third floor comprises the tropical section of the museum and the large department (12,000 sq. ft.) required for medical biology. The top or fourth floor provides for chemistry, biochemistry, and bacteriology, a cinema unit, animal quarters, and caretaker's flat. The basement contains a P.M. theatre, X-ray and photographic rooms, stores, cloakrooms, and heating and ventilating plant. The central court is approached by roadways from both streets under the lecture theatre. An accelerated hot-water system was proposed for heating, and an extract system of ventilation by fans, operating in four vertical shafts. The construction proposed was a steel-framed building, with filler joist floors and brick wall faced in Portland stone. The fittings and engineering services, which are elaborate, involved the submission of a separate set of plans for their elucidation. The cube of the design is 2,555,144 ft.; and the cost of the building and its fittings was estimated at nearly £350,000.

Wyke Manor, Pershore, Worcestershire.

This house replaces an eighteenth-century one of poor design, erected on the site of a much earlier house or half-timber which was destroyed by fire. The plan follows, as far as possible, the outlines of the original house, with an inner courtyard of irregular shape. The building, including the interior panelling, was carried out by Messrs. Bridgeman & Sons, Lichfield; the heating by Messrs. Comyn Ching & Co., Ltd., London; and the electric lighting by Mr. T. A. Savage, Acton. The architect was Mr. Cecil G. Hare.

Loggia and Courtyard, Grosvenor-square.

This attractive enclosure has been built from the designs of Mr. E. Vincent Harris, F.R.I.B.A., at the back of Mr. Courtauld's house, No. 47, Grosvenor-square. The garden wall to Carlos-place is an excellent piece of design in plain brickwork. The general contractors were Messrs. E. H. Burgess, and the following were sub-contractors:—Messrs. Grierson, Ltd., electric light; Messrs. Ames & Finnis, tiling; Messrs. G. Jackson & Sons, Ltd., fibrous plaster work; The Daneshill Brick Co., special bricks; Messrs. Rust's Vitreous Mosaic Co., mosaic work; Messrs. Carter, squash court plaster; and Mr. George Alexander, carving.

A Cathedral of Humanity.

We illustrate this week a thesis design by Mr. T. T. Wills, a fifth-year student of Liverpool University School of Architecture.

New Operating Theatre, Hospital of St. John and St. Elizabeth.

We regret that in connection with the illustration of this operating theatre, published in our issue for November 27, the initials of Mr. H. W. Binns were inadvertently omitted. We are asked to state that Mr. Binns has acted as sole architect in connection with much work at the Hospital, spread over a period of nearly fourteen years.

Building in Cheapside.

We regret that the small plan given at the top of page 772 of our last issue, illustrating a work of Messrs. Gunton & Gunton, F.F.R.I.B.A., was wrongly ascribed. This relates not to the Westminster Bank (the plan of which was not given) but to the small site between the Bank and Messrs. Sweetings' building.

MEETINGS

SATURDAY, December 5.

Building Surveyors' Association.—Quarterly General Meeting. At the School of Technology, Whitworth-street, Manchester. 2.30 p.m.

MONDAY, December 7.

The Society of Engineers.—Mr. H. E. Irving Taylor on "The Growth of the Gothic Church Window." Burlington House, W. 1. 5.30 p.m.

The Institution of Structural Engineers.—(Midland Counties Branch).—Annual Meeting. At the Chamber of Commerce, Birmingham. 7.30 p.m.

WEDNESDAY, December 9.

Liverpool Architectural Society.—Lieut.-Col. H. P. Cart de Lafontaine on "Devastated Regions of France." 13, Harrington-street.

Edinburgh Architectural Association.—Chief Constable Ross on "Traffic Problems in the City." At 15, Rutland-square. 8 p.m.

THURSDAY, December 10.

Society of Antiquaries.—Lieut.-Col. H. F. Bidder on "Recent Excavations at Merton Priory." At Burlington House, W. 1.

Institution of Structural Engineers (Yorkshire Branch).—Mr. E. F. Sargeant on "Concrete Granary at Hull." At the Great Northern Hotel, Leeds. 6.30 p.m.

Architectural Association.—Conversazione. At 34, Bedford-square, W.C. 1.

Southampton Dock Extension.

The plans for the construction of new docks at Southampton by the Southern Railway Company are nearing completion. The scheme will be completed in sections and will occupy several years, the first portion costing £5,000,000. This initial section includes the construction of jetties, capable of accommodating the largest liners afloat, on reclaimed land along the western shore in the direction of Millbrook. The whole scheme will cost over £13,000,000.

ARCHITECT'S CLAIM FOR FEES

IN the County Court, Exeter, recent Mr. Thomas Andrew Andrews, architect and surveyor, Matford-road, Exeter, sued Mr. George Packham, of Rosemullion, Limerick, Cliff, Torquay, and formerly of Hollingdale House, St. James-road, Exeter, to recover £100 in respect of professional services in preparation of plans, specifications, etc., for the conversion of a house into flats.

Mr. F. S. Laskey, counsel for plaintiff, said that Mr. Andrews was consulted by the defendant in August of last year regarding a scheme he had in his mind for the conversion of Hollingdale House into flats. He asked plaintiff what the cost would be, and plaintiff said it was impossible to say accurately, but it would not be less than £700. On the defendant's instructions, plaintiff made a survey of the house, but the scheme was abandoned as it was found to be impracticable, mainly owing to insufficient bedroom accommodation. A much more expensive scheme was adopted and plaintiff was asked to find out what the flats were likely to fetch. He made up figures and found that the probable rent would be £190 a year. He was then asked to prepare plans and get them passed by the City Council, and also requested to prepare bills of quantities and obtain estimates, the defendant naming certain builders from whom tenders were to be invited. The lowest tender was £1,546. Defendant never suggested that time that he was not prepared to expend so large a sum, but he asked plaintiff to prepare the bills of quantities, and plaintiff worked out at £1,512. On January 25 last, defendant wrote that the scheme would be too costly and that the proposed work must be abandoned. He asked plaintiff to make his costs as small as possible, as the scheme had been a loss to him. Plaintiff told him that he had spent over 200 hours on the work, but would not charge him the full scale. It was not until April that it was suggested that plaintiff had exceeded his original commission, and he offered to refer his account to the arbitration of any architect in the city.

Giving evidence, Mr. Andrews said that he charged the full fees his account would have been between £140 and £150, and that on the lowest scale he would have been entitled to £115 or £120.

Mr. John Challice, an Exeter architect and honorary secretary of the Devon and Exeter Architectural Society, produced figures indicating that on the work done by plaintiff was entitled to fees amounting to £115 15s.

Defendant told the judge that when he consulted plaintiff he made it plain that he did not spend more than £700, as the house was not worth it and he would not get a remunerative rent from the flats. After the first was abandoned, plaintiff drew two sets of plans as alternative schemes, and recommended one of them. Witness took his advice, thinking the work was going to cost £700 nothing further had been said about the cost. When the tenders came in, witness told plaintiff he could not spend anything over £1,500 and that he must turn down the value of the tenders. He denied instructing plaintiff to make out cost prices.

Mrs. Packham, wife of the defendant, having given similar evidence, the judge found for the plaintiff for the amount claimed, less costs.

Proposed New West-End Library.

The London County Council propose to erect a new public library in Orange-street, Leicester-square, the accommodation to consist of a sub-basement floor, and ground, first, and second floors. The R.I.B.A. is to be invited to submit to the Council the names of three of its members from whom the Council could appoint an architect, a condition being that the architect shall submit plans within three months of the date of appointment.

PHILIP WEBB AND HIS WORK.—XI

By W. R. LETHABY.

LATER LONDON DAYS AND HOUSE SEEKING.

CHARLES FAULKNER died February 20, 1892; he had a stroke in October, 1888, and in the interval, so far as possible, Webb visited him every evening. Madox Brown died in 1893, and Boyce followed in 1895. From the beginning of the year 1896, Morris was so ill as to cause great anxiety, and in the summer he was advised to take a voyage as told in his "Life." In his return he wrote to Webb:—

"August 18, 1896.—My dear Fellow, I am back. Please come and see me. I saw Throldmose—big church, terribly restored, but well worth seeing; in fact, as beautiful as can be. It quite touched my hard heart.—Yours affectionately, W.M.

"P.S.—Somewhat better, but hated the voyage; so glad to come home."
On October 6, 1896, Morris was carried in a arm-cart to his grave (the only funeral I have ever seen that did not make me ashamed to have to be buried). This was the beginning of Webb's being unable to keep going in business. "My coat feels thinner," he said; then, with an attempt to change the tone, "Well, a man must expect to die if he will live to over sixty. He is not dead after all. . . . But one would

think I had lost a buttress." When he designed Morris's tomb for Kelmscott, he said, "It seems to me that I've been designing nothing but tombs all my life." The tomb has a coped top like a house roof, and Mr. Cockerell tells me that it was modified from a tomb already in the churchyard; "to follow a local lead and improve upon it was characteristic of Webb." On his design, the grass was exquisitely drawn as a sort of offering to Morris. Burne-Jones wrote to him a little later, asking for notes "for the facts about the life of our beloved Top." Faulkner's sister Kate died in 1898; she had worked for the firm from the early days, painting tiles and doing gesso work; she also designed some excellent wall-papers. She lived in Caroline-place, and Webb kept up the regular afternoon visits after Charles Faulkner's death. In a letter he spoke of "that most excellent of workwomen."*

Webb now began to talk of giving up his Gray's Inn Chambers. "Cannot afford them much longer," he would say; "I must shuffle

* Her sister Lucy (Mrs. Orrinsmith) was the author of a small book on house furnishing, entitled "The Drawing Room."

off this professional coil shortly." He was getting tired and feared some breakdown of strength. During the last years we had several little excursions. "October 4, 1897.—Webb and I went to Chichester to examine the Cathedral for S.P.A.B.; met Cockerell there and had a most stimulating day."

On the last day of July, 1898, we walked into the City, and saw through a chink in the hoarding the destruction proceeding of the crypt of Crosby Hall. Other times, the Temple Church and Westminster Abbey were visited. Standing in the Confessor's Chapel under the apsidal vaults, with the spreading ribs and plank-like lines of the courses between, he said, "Doesn't it look like a great ship?" Again, we went with Cockerell to Richmond, and walked in Petersham Park by the big thorn trees which had been studied by Burne-Jones for the Merlin picture, or was it "The Merciful Knight"?

Mr. C. C. Winnill, another younger friend of the later years, writes: "During the last year that P. W. was in town I often had a walk with him after 5 o'clock; the way was generally down to the river, then into the City, working round to the south-east of St. Paul's; the view from this point interested him, the outline appears distorted. I must have spent hours with him in and around St. Paul's—he cared for the building very much. I remember his calling my attention to the internal stanchions of the windows as being suitable and strong. Anything I know of architecture is due to P. W. I partly knew how favoured I was, but not wholly. . . . You know that it is not easy to end off a Mansard roof; at the gable ends it is almost always awkward. I was out with P. W. near 'Caxtons,' and he drew my attention to a farm building (I think) in which dormers were set at the awkward angles with happy results. It does not look much on a sketch, but one can ring many changes on it."

Another younger man who visited Webb is mentioned in a letter of 1897: "Percy Horne came in last night and told me of his work in Italy last winter; a good sort of fellow."

All through 1899 he was loosening himself from business bonds, and searching for some little house in the country where he might live in peace. In looking about for a country home he thought of Charing, but there were too many stockbrokers about; saying this reminded him of a young man whose talk was of "A friend of mine who is on the Exchange, and Mr. X., a stockbroker." When he spoke of anyone and was asked "Who is he?" the reply was "Oh, a stockbroker."

On March 10, 1899, Webb went to Wales to see if he could find a cottage, but he was put off by the trippers and the towns on the way. "Four big hills and some little ones." The character of the country, however, was very beautiful, and he came back much moved by it.

He visited Wales partly to advise on the repair of two little churches in which his friend Mr. Treherne was interested. Eglwys Cummin and Eglwys Brewys were "as solemn and big as cathedrals," but the right dwelling was not found. "Anyhow, I have washed my feet of architecture in Wales."

Saturday, April 14, 1899.—I looked in at Raymond Buildings to arrange for going out in the afternoon. He made me stay to lunch, opening what he said was his last bottle of Greek wine—"at least forty years old." "Such body!" "Such soul!" said he, "like stems of dried grapes, like cedar pencils, like the Forests of Lebanon, like the Parthenon." A floating film reminded him of being with Browning who saw the "beeswing" in some Port. We went to Westminster Abbey and on to South Kensington Museum Library.

House seeking comes so near every one of us, and Webb's letters about it are so pleasant that they may be quoted at some length, especially as they introduce us to another group of his younger friends. Ernest Gimson and Sidney Barnsley had been neighbours in Gray's Inn who had left London some years earlier to make a living home in the country.

To Ernest Gimson, April 10, 1899:—
"My dear Gimson,—That dragoman of friends; the interpreter of all wants; Sydney

FIG. 1.—TAPESTRY CARTOON.

FIG. 2.—TAPESTRY CARTOON.

Cockerell, has told me of his visit to Pinbury and of the kindly entertainment he and Emery Walker had from you and the rest of the little colony. He may have told you of my failing in South Wales to find a place of retirement in my old age, and that may have suggested the possibility of finding a sufficient hut, or Diogenes tub near Cirencester. With regard to Cockerell, I need hardly say I am as clay in his hands, so that when he produced a simple sketch of a possible and vacant cottage, with an exclamation amounting to 'there you are'—what was I to say? The limestone of the Cotswolds would, I think, be good seating for my worn bones. . . . If it seemed a possible place I had better come and see it as soon as possible. Perhaps you would add to your thoughtfulness by writing one word as to friend Cockerell's interesting legend; for your knowing the neighbourhood would be my safety against mistake. . . .

"Yours thankfully,

"PHILIP WEBB."

On April 28, 1899, Webb went to Pinbury, but without finding the dwelling he required. He returned "intoxicated with the beauty of the country and drunken with ozone," but disappointed—nothing was found. On August 15, Gimson sent him a photograph of a "cottage between Duntersbourne House and Edgeworth," but wrote again immediately: "None of the rooms are six feet high and all are damp; when we heard of the winter fogs we decided it would not be kind to give you the slightest hope."

To Ernest Gimson, August 18, 1899.

"Dear Gimson,—Having allowed a day for quiet consideration, I now acknowledge your

kindest of letters assisting a poor old fogey to his ante-penultimate home. You send me a view of an enchanting double cottage which promised a perfect vestibule to the eternal silences (as Carlyle would have put it), and yet its ideal attractiveness is but a wile luring to the fatal 'mists.' 'Tis a wise admonition never to buy a horse for a friend—and this may equally apply to finding a cottage for a somewhat exacting old man. . . . My work has been playing the devil with me for the last two years or so, and also for Jack; having been worn down by heat and my irritability, I had to hurry him away to his native heath, whence he writes that he is mending; and adds, 'the gulls are everlastingly interesting and their skirling is, as you say, just like you and me over a drain plan.' It is an interesting form which attaches to the double cottage of your district, built, as they are, in the form of church plan, nave and chancel. The Sanctum Sanctorum would be in the smaller end, where the priestess over her cooking pot would be serving the Lord and Lady in the Nave—for are not the poor the fenders for the rich? I suppose the small freeholder lived in the nave and his henchman in the chancel? . . . There have been times when I purpled up at the thought of your industrious efforts on my behalf. . . ."

To E. G., end of August, 1899:—

"... There is now no doubt that the East hill cottage would have 'done for me' in the modern slang sense. What I have thought in the rough, is this: When I have cleared off my exacting work here I might stay for a week at Cirencester and perhaps find a smallish cottage with a bit of garden in the quietest suburb thereof. . . . Your generosity will unless you draw the line somewhere, lead you to keeping a 'doss house' for all the wastrels of London town. . . . I found, in the part of South Wales I saw, that near the sea the air was relaxing, but at two or three miles inland, at 500 B.M., the air was very bracing; I could eat and walk reasonably well there, whilst here I can do neither. . . . From what I saw and in the short time could understand, I was much impressed with the quality of the fabrics you were turning out; and the work of the prehistoric-looking lathe made me think you could turn a timber leg for that never-dying lame sheep we saw."

On September 28, 1899, he gave provisional notice of terminating his tenancy of the Gray's Inn chambers, adding: "Will you favour me by communicating to the Benchers my thankful sense of the courtesy with which I have been treated by them during the thirty six years of my residence in the Inn."

March 9, 1900:—

"My dear Sidney Barnsley,—Just as I was

FIG. 3.—PENCIL DRAWING.

using my outer door this evening on my way to the post, and for a constitutional, Detmar now mounted the stairs. He walked a piece of the way and told me he had just come from Pinbury, and that a cottage near Cirencester Park gates was to let. Now, I am all fluid, as were, having agreed to leave here at Michaelmas and with no other lodging in view, and we are rooted dislike to househunting. But go must by the time cuckoo tells the same tale. This news by Blow has set me all agog not to miss a chance of finding a decent home on high ground, if only for a year's trial to see how it goes with me. I know that either you or Gimson have the 6 in. ordnance map of your district, and I believe reaching as far as Cirencester; could you, therefore, kindly make me a slip of pencil tracing as to where the said cottage stands, for the 1 in. is too unclearly defined for me to make the situation out? I have two sheets of the 6 in. map, but it only extends to some miles east of Pinbury. Should I be thought to trespass too rudely on your known good nature by asking you on your next visit to Cirencester to have a look at said cottage? If it had not been out as much room in it as that you took me to see at Francombewood corner, that would do well enough for the simple body—but before going to see it personally, I should like to know something about it. This is rather a heavy rain upon friendship, I know, but one cannot go through the world, however self-reliant, without laying oneself out to incur obligation. The place would at all suit, I should much like to be as near to you and yours, and perhaps when I found my country legs once more I might be able to walk as far as Pinbury and back in a day, and you could cheer me up when you are marketing, and take your bread and cheese with me; have already imagined it thus. Perhaps, if the place did not do for me, I might try a year or so on the look out for a better district, for the Cotswolds I would rather have as well as the Barnsleys and the Gimsos. Please give the latter my kindest hail of greeting, and also your brother, and the good women folk. I should have written before now to my old respondent Gimson, but as he has taken to the business of match-making I thought he would rather be free of my fussy-jaw! (do not impute this very innocent jest). To tell you the

truth, the nearer I get to the time when I must leave here, I feel to be glued to my chair. However, once break through the habit and trundling will come easily enough—and that may become a habit. I saw somewhere the other day an aphorism that 'all habits are bad, even good ones.' Your brother's report to the S.P.A.B. the other day on a church, called forth unanimous encomiums from our committee. . . ."

March 13, 1900 :—

" . . . Should I be able to clear off my tiresome work by the end of this month, I shall make the effort to go Sapperton way and make the acquaintance of Mr. and Mrs. Wheelwright. . . . I hope your rooks are as much aware of the season as mine are, for they are cawing delightfully from three nests opposite my window to my heart's content.—Yours always
thickly,
PHILIP WEBB."

Rounton Grange, Northallerton,

April 13, 1900.

" My dear Webb,—Your work ought to be completed by this time. I send this to say Ingleby Hall is in my possession—a very nice house now inhabited by a caretaker and his wife. I implore you to come down, stay there as long as you choose and when you are wishful to see society come over here. I still feel I am in your debt and want you to work it out by letting me pay you a professional fee for your advice. You need do no sums, draw no plans—just tell me what you think.—Yours faithfully,
"LOWTHIAN BELL."

Webb, in replying to his kind old employer, pretended, after thanking him, that he desired to undermine his principles. " Indeed, I believe you quite capable of trying to encompass my moral destruction out of the kindness of your heart."

Mr. Hale White offered to " buy half-an-acre at Uckfield or Buxtead, or some untouched agricultural village, and you could put a cottage on it for which I also would pay, and it would be an investment for me."

To S. B., May 5, 1900 :—

" . . . I have had a communication with a man at Stanton—six miles south of Broadway, about a cottage-farmhouse there, which it was

FIG. 5.—PENCIL DRAWING, FULL SIZE.

thought might suit my needs; but I found it beyond my ways and means as well as inclination—£30 a year rent, sitting and five bedrooms, offices, garden, orchard (and shooting, £15 extra!).

In June, 1900, Webb visited the Cotswolds again, lodging a week at the house of Richard Harrison, a fine man and wheelwright of the old sort. The friends rambled widely about, seeing Daneway, Thurston and Bisley, where the curious churchyard lantern (?) greatly interested him. Asking Mr. Barnsley about this time, he tells me, " The impression I have of Webb's, how perfectly he fitted in with the country; he looked part of it in the same way as a ploughman does when ploughing, and his knowledge of the country, birds, flowers, trees, and everything, was immense, and by that I don't mean book knowledge. (Dear old Gimson was the same.) Webb had a like knowledge of the crafts. I can picture him now sitting in ' Dick's ' yard watching the making of a wagon and telling how it should be done and why; he really did know, and it was not as a clever architect pretends. He was a real countryman in that he appreciated Nature in all her moods and not only when the sun was shining. I remember one afternoon walking to Throgmorton to see the old house with the stone down-spouts when a very heavy thunderstorm came up and Webb quite skipped with delight—he said the air made him feel like a boy. We sheltered in the farm and nothing would coax him till he had seen the dairy. The country people accepted him straight away as one of themselves. Those were happy days. Webb and Gimson still remain part of the dear country, and they didn't see what we have to see in the way of after-war horrors of cheap building!"

Cockerell and I went down with Webb to Worth, in Sussex, on June 30, 1900, to see " Caxtons," a cottage, or rather small farmer's house, belonging to Mr. Wilfrid Blunt.

In July, 1900, he visited Treherne on his boat the *Heron*, for three days. In a letter he speaks of coming down the estuary reaches of the Stour: " I hope that the breezes fill your sails without ruffling G. W.'s [George Wardle's?] plumage." This unwonted holiday must have been for the purpose of prospecting for a cottage.

To Sidney Barnsley, July 8, 1900 :—

" . . . Cockerell carried me to Worth last week, or rather the Saturday before. The place had its attractions, both in the cottage and in the neighbouring forest land, with its wonderful Saxon church, so-called, more astonishing even

FIG. 4.—RAVEN ON SHIELD.

FIG. 6.—PENCIL DRAWING, FULL SIZE.

than that of Bisley. . . . Have been nothing like so well in health since I was with you, partly in that my work has gone badly and partly because I think your highland air suited my ancient constitution. I am going again to Worth sometime in next week to make up my mind as to that place. . . . The wonderful tale I told Wardle of the Bisley well-lantern set him all ablaze archæologically. . . . Walker and Cockerell have entered into the bonds of business, and both look very happy in their honeymoon. Give Mr. and Mrs. Dick my blessing when you see them, and greet all of your households with the kindest wishes from

"Yours very truly,

"PHILIP WEBB."

To A. H. P., August 7, 1900 :—

"Good builders, my good Alfred Powell, do not hang plenteously on the prickly gooseberry bushes of architectural practice. . . . Perhaps it may interest you to know that the convulsions of second childhood are on me, in the quality of a divided mind; for there are still just hopes of the Gimson and Barnsley folk finding that the smallest of steadings, by Tunley Farm, may be had for me; and failing that coveted situation I may get housed in Sussex. But time strides and I ought to be out of this hitherto faithful home by Michaelmas—a problem and I am no mathematician."

August 10, 1900 :—

"My dear Sidney Barnsley (cum the rest of the colony—for I cannot separate you),—You have—all of you—from the oldest in years down to the beard-pulling baby, been so friendly and helpful to me, that Pinbury in all its forms and ways has become a sort of vision of the New Jerusalem, as the peace of Gray's Inn Garden that of the old. . . . I went down again to see Mr. Wilfrid Blunt's cottage at Worth—a mile from Three Bridges—and spent some time in finding out the fors and againsts of it. The little house, little garden, and little orchard, I thought all to the good. The drawbacks were the nearness to London, and the height above sea-level, only 340 feet as against the 600 of Tunley. . . . I could have the place at once and set about exorcising the evil spirits—not ferocious ones—and could hope to get in by the end of the coming October. Tenancy not to be disturbed during life, Rent £15 a year, Landlord to spend £150 on repairs. As some equivalent for such consideration, I receive my landlord as guest for an occasional night or so when he had to come over to look after a bunch of the Arab horse stud at Worth. As I am rather horsily given conversation would be easy; and being semi-Arab in his own habits, dates and well-water would be in the bill of fare. . . . With these inducements to content, I am disappointed, and only half-hearted, for the larger half is in the Cotswolds. . . . I now write to Mr. Blunt in the way of acceptance."

August 31, 1900 :—

" . . . I could not wait all my dear people. None, nor all of you could have been so disappointed as I am that I did not get to the good district of Pinbury, for I was so at large with all of you there . . . and there will be no childish sheepdog and dignified deerhound to welcome me. . . . Alas, and alas! the doctors have had to send Alfred Powell off for a sea voyage for a fortnight or so. . . . Cockerell, the faithful dragoman to friends in difficulty, with his boundless energy, will lift the lame dog me over the stile of flitting; when I hum and ha, he does the thing, and I smile as if the sun had broken through a cloud. Wardle was mightily pleased with your photographs of the Bisley lantern."*

September 26, 1900 :—

" . . . Have I not now the jolly A[nglo] S[axon] doorway of Somerford Keynes in the full flesh of photography? My stars, Master Sidney, is he not a jolly good one, too! It seems to have escaped the claws of the devilish restorer. I wish the devil had left alone my A.S. church at Worth. . . . I have just looked in Murray's Guide to Wilts . . . not so much as noticing Sd. Keynes on the Thames; and this is English thoroughness—in not doing it. I wish St. Dunstan had a good grip of the Editor's nose with his A.S. hot tongs. Oh, yes! I remember that smaller house, Throngham Slade, with its stone gate posts fitted into the low base wall. We went up the lane at the side of the house to look at the back, and were objurgated by the fowls; also I am most glad to have the photos of the stone down-trunk house of many gables. 'Twas a sweet walk we had, and it pleases me you should have jogged my memory, giving it a lasting vibration with the pleasant photographs. I heard from Winmill yesterday telling of his enjoyment of the sea-borne city. I have also received a comfortable letter from Alfred Powell steering in and about the Greek coasts on the way to Smyrna, having spent a day at Constantinople and got a look at St. Sofia. He wrote one of the most enchanting letters of travel I have ever had. I was at my new old country seat yesterday, and there was nothing for it but to strip and relay the tiles of all the roof. . . . Of wood there is plenty close to my back door which can be had at 10s. a cord, which, I gather, is 4 by 4 by 10 ft. The sawing will do me good, as well as winding up the water from the deep well. 'Twill be a good system to cure Gray's Inn home-sickness. London, however,

FIG. 7.—TOMB OF WILLIAM MORRIS.

is too big for any other office of life than hiding oneself under a bushel of regular insistent work, and I am not strong enough now to fight my way through the overcrowded streets. What is above them and below is a maze of pipes, cables, wires, &c. Always thought pigeons to be clever on the wing, but that they do not strike the harp strings in the sky is the cause of amazement. With hearty good wishes to the brother and sisterhood and childerhood. . . ."

To A. P. H., October 23, 1900 :—

" . . . My delight was great in getting your cheerful letter from on board ship off the Greek coasts and on your way to Smyrna. It cannot be said when I have had so entertaining a note of travel. You made the famous lands I have

* A little spire like thing with an open stage: 'is it a *Lanterne des Morris*!

never seen fairly dance before my mind's eye. Personally I am in the throes of decided indecision whilst trying to break up camp here for the new dumping ground, where new-old Diogenes tub is lazily having its hood tightened to receive its new tenant at Angl Saxon Worth in Sussex. Having limpet-like stuck so tightly here for so many years it takes a strong oyster-knife to unfasten me."

One memory of this time may be recalled. In reducing his few possessions he seems to have had a dislike of selling them—especially those which had been presents to himself. The Burne-Jones landscape studies were given back to the family. Madox Brown's drawing of others he also gave away. He had decided to present his valuable Kelmscott books to some public body who might be expected to preserve them. Fairfax Murray's copy of Carpaccio's George, which he had commissioned when with the artist in Italy, he sold to the Birmingham Art Gallery; most of his books were also so.

As Webb was leaving I told him he should have for epitaph, "He fought the good fight." "And received a black eye," he replied. "I hope providence will temper the shorn lamb to the prevailing winds."

THE LIGHTING OF PETERBOROUGH CATHEDRAL

THE new lighting system of Peterborough Cathedral was formally inaugurated on October 1st and has proved completely successful. The effect of the flood lighting substituted for the gas used hitherto is impressive, and entirely keeping with the character and appearance of the Cathedral. Owing to the fact that the lighting units for the most part are situated either side of the clerestory windows, the light is in respect of direction and distribution similar to daylight. Shadows are few, and are of depth and distribution of those cast by the sun. A comparison of the photographs taken by daylight and by the new electric lighting will demonstrate the close similarity which exists between the natural and artificial illumination.

The greater portion of the lighting is effected by units placed on either side of the clerestory windows—so that the artificial light comes from the same direction as the daylight, and the units being placed at a considerable height above the floor, are beyond the normal angle of vision. The units are suitably grouped together, and controlled by contractor switches placed in triforium in the north and south transepts. These contactors in turn are controlled by push button panels placed immediately behind the choir stalls on the south side. The contact panels on the north and south sides respectively are fed from the two sides of a 400 volt, three wire, direct current supply from the Corporation Electricity Works. Each lighting unit consists of a projector comprising three silvered glass mirrors equipped with a 250 watt projector type Mazda gas-filled lamp. The lamp is supported in a porcelain holder mounted on an adjustable bracket, so as to permit of its being correctly focussed. The beams from these projectors are trained diagonally downwards across the cathedral towards the bottom of the piers on the outside of the nave. Beneath the central lantern tower eight special units are mounted near 100 ft. above the floor, each of which is provided with a single silvered glass reflector, and a device to prevent the light "splashing" on the walls in the upper part of the tower. The lighting of the eastern end of the apse, and certain other situations, is effected by Mirolox trough reflectors fixed in a suitable position in the triforium and clerestory.

Mr. Nevill, the City Electrical Engineer, and as consultant to the Cathedral authorities; and British Thomson-Houston Co., Ltd., were responsible for the design of the installation and the manufacture of the lighting units and Mazda lamps; and Messrs. Amies & Sons, the local contractors, for wiring and erection of the gear.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

Pickling Paint off Woodwork.

[REPLY TO "OLD DEAL," NOVEMBER 20.]

SIR,—Use a good patent paint remover, such as manufactured by any of the good-class paint manufacturers. If the type chosen is of the alkali kind, wash over the surface with dilute vinegar after using the remover. PATENT.

Size of Radiators.

[REPLY TO "A COMFORT," NOVEMBER 20.]

SIR,—I should advise putting in three 24 in. "Classic" radiators, each of eight sections, one under each window, presuming there are three (which the glass area quoted rather suggests), or otherwise arranged if this assumption is not correct. This should give a surplus of heat, which can be regulated to the best advantage as required. It is usual to calculate for a temperature of 55 deg. if there is an open or gas fire to assist, but this is purely empirical, and will depend very largely upon the arrangement of the room. With the boiler on a level with the radiators served, very careful design of pipe runs and capacity of same is necessary to ensure a good circulation, and this is best arranged on the site by a good expert with an eye on all details concerned. DATA.

Internal Finish to Walls.

[REPLY TO A.H.G.B., NOVEMBER 20.]

SIR,—Your correspondent calls attention to a carelessly worded phrase in my letter under the above head. I am certainly incorrect in stating that no cement will stand in a permanently damp situation, as it is a well-known fact that many tanks are lined with waterproof cement, and many sea-walls and river walls are built of cement concrete. For the internal finish of walls I do not know of any finish that will stand in this condition without bringing with it the evils of condensation, and this I particularly had in mind when making the above loose statement. If there is such a finish, I should be extremely glad to hear of it. WATERPROOF.

Dairy Floors.

[REPLY TO "DAIRIES," OCTOBER 16.]

SIR,—After 20 years of designing and supervising the erection of butter factories, milk factories, cheese factories to the extent of some two million pounds, my experience has taught that no cement floor will stand up for any length of time. In any factory where milk or by-product of milk is treated, I found that nothing but encaustic tiles would answer the purpose—that is, a good bed of concrete, depth as required by sub-foundation, 6 in. by 6 in., encaustic tiles laid on a bed of cement mortar, not weaker than 2 parts sharp sand to 1 part cement, joints of tiles as close as possible, well grouted with neat cement, then the whole treated with 3 coats of fluride of zinc. This proved successful.

JOHN MARSHALL.

Hard Tennis Court.

SIR,—Could a cheap hard tennis court be constructed with 3 in. concrete and $\frac{3}{4}$ in. granolithic? If this may not be suitable for playing upon, what would be the most economical construction?

W. DRAKE.

Making Partition Soundproof.

[REPLY TO "AJAX," NOVEMBER 27.]

SIR,—The floor, partition and ceiling over can be made soundproof by packing the space between the plaster ceiling and the floor boards with bitumen deadening felt on the laths, and then with slag wool or silicate cotton; the same process should be applied to the partitions and the ceiling over the w.c. This method I have used for audition rooms for gramophone testing with good effect.

G. W. H.

SIR,—Your correspondent will probably find that a near enough state of sound insulation will be obtained by taking up floor boards and stripping one side of the partition and filling in all cavities between joists and studs with slag wool plugging, and I should recommend him to try it. If it is possible also to insert a thick felt mat under the w.c. pan this will also assist.

Contract Documents.

SIR,—Where tenders are invited, under an entire contract, for the erection of a building, what documents must the contractor actually have in his possession so that he can prepare his estimate?

T. L. W.

Aggregate.

[REPLY TO "G. E. S.," NOVEMBER 27.]

SIR,—In your interesting reply on this question you state that it is always safer to specify the proportions of fine and coarse materials for concrete. May I beg to differ from you in this matter—at any rate where there is a good clerk of works or a trusted general foreman in charge of the works? I have found that the amount of fine stuff required adequately to fill the interstices of the coarse stuff varies considerably according to the material used, even though the latter is of specified gauge, and this is probably due to the average shape of the parts of the material. As an efficient concrete is that in which the coarse aggregate is just, and only just, rendered compact with the fine, a hard-and-fast specified proportion between the two is actually a handicap and may very well defeat its own object. With regard to the contractor's contention, he appears to mean that a mix of 6-1 concrete will have six measures of coarse stuff alone dry, and that the fine stuff, although measuring alone probably three measures, does no more than fill in the interstices, and the bulk of the aggregate mixed together still measures six measures only and not 6 plus 3. In this I consider he is quite justified under the specification.

"SUPERVISOR."

Destroying Beetles.

[REPLY TO "W. B.," NOVEMBER 27.]

SIR,—A good spraying under floor boards with a strong solution of formalin will bring the relief required.

"SWATTER."

New Reptile House for Zoo.

The Council of the Zoological Society has decided to proceed with the construction of a new reptile house. It will be placed close to the aquarium, on a site of about 170 ft. by 70 ft. wide, now occupied by the ape house and the summer aviary. Mr. Guy Dawber, P.R.I.B.A., is the architect.

Peterborough Cathedral: Transverse Section through Nave showing arrangement of Lighting Units (See page 815).

THE WEEK IN PARLIAMENT

Scottish Housing Subsidy.

Asked by Mr. T. Kennedy if he had considered the protest of the National Building and Engineering Federation against the promise recently given of an increased subsidy to Scotland on houses of a particular construction; whether an opportunity of Parliamentary discussion would be afforded this session of the finance and other consequences of this increased subsidy; if it was proposed that the increased subsidy should under any circumstances apply to other forms of house construction; and, if not, whether consideration had been given to the effect that this increased subsidy would have on the general building industry. Sir J. Gilmour said that the protest referred to had been considered. An opportunity for Parliamentary discussion would be given when the vote for the Scottish Board of Health is presented. The increased subsidy was proposed for houses of any alternative construction which did not require more than 10 per cent. of skilled building trade labour, and the houses now approved by the Scottish Board of Health were of various types, including concrete, timber, and "steel." This increased subsidy was for a limited number of houses, forming only a small fraction of the Scottish needs, and he was quite unable to see that it would have any prejudicial effect on the general building industry.

Safety of Workmen.

Mr. Scrymgeour asked the Home Secretary whether he would amend the Departmental Draft Regulation under Section 79 of the Factory and Workshop Act, 1901, so as to safeguard the lives of workmen engaged in operations upon buildings other than premises on which machinery was being temporarily used for construction of a building or for the purpose of any addition to the structure of an existing building?

Mr. Locker Lampson said that if the honourable member's suggestion was that the draft Regulations should be extended to cover all building operations, this could not be done without fresh legislation. Under Section 105 of the Act, the power to make Regulations for building operations was limited to the premises specified therein.

Houses Completed.

Mr. N. Chamberlain, Minister of Health, informed Mr. R. Smith that the numbers of houses completed during the year ended September 30 last under each of the Housing Acts was as follows:—

Act of 1919	1,497
Act of 1923	78,409
Act of 1924	12,385
Total	92,291

In addition over 67,000 houses were built during the same period by private enterprise without assistance under the Housing Acts.

Gas Fires.

Mr. N. Chamberlain informed Lady Astor that in a large number of local authorities' housing schemes gas fires had been installed for cooking and heating, which had, of course, resulted in considerable reduction of domestic smoke.

Weight of Steel in Houses.

Mr. Wright asked the Secretary for Scotland the weight of steel used in the construction of each of the four types of houses specially selected for the additional housing subsidy; and what was the weight of steel used in other types of steel houses?

Sir J. Gilmour said that only two of the four makes of houses approved for additional subsidy used steel sheets in their construction. The firms were Messrs. Cowieson and Messrs. Weir, of Glasgow, and the weight of steel sheets per house used by the former was 1 ton 9½ cwt. for the bungalow type, and 1 ton 8½ cwt. for the cottage type; and by the latter, 1 ton 3¼ cwt. for the Blenheim type, 1 ton 4½ cwt. for the Eastwood type, and 1 ton 16 cwt. for the Douglas type.

THE BUILDING TRADE

RATING AND VALUATION BILL. REPORT STAGE.

GOOD many amendments were introduced to the Rating and Valuation Bill on the Report Stage in the House of Commons. Before considering them we may refer to a matter which arose in the course of the debate. Mr. Barker moved for the insertion of a new clause exempting underground sewers from rating, on the ground that this was a hindrance to necessary sanitary measures. The Minister of Health pointed out that the present Bill made no alteration in this practice, but he expressed sympathy with the object of the proposed clause, and said that the case of sewers, both underground and above ground, and also other constructions such as water pipes bringing water from a distance necessary to sanitary additions appeared to deserve attention, and hoped he might be able to amend the Public Health Acts as regards this question at a future date, although he could give no guarantee as to future legislation.

In the present notice we are unable to refer to the discussion on clauses which were not actually amended, as we are confining our observations to actual amendments carried, and the first amendment was in Clause 1, giving the parish council of every parish or group of parishes, and the parish meeting of every parish not under a parish council, power to appoint two persons being local government officers to act as members of the rating authority. Clause 5, which relates to the amendment of rates and which provides that not less than seven days before making any amendment notice of the proposed amendment shall be sent "to the occupier of the hereditament," was amended by substituting for these latter words the words "person liable to be rated."

Clause 6, which relates to the publication of rates, was amended on the motion of the Minister by the insertion of the words "Notice of every rate shall be given by the rating authority within 7 days after the making thereof, and the rate shall not be valid unless notice thereof is duly given in manner for the time being required by law." What the effect of this amendment may be it is impossible to say until the clause is re-drafted, for if the clause stands as it is it becomes law the method of publication prescribed in the clause—notice fixed in some conspicuous place, publication in newspapers and different methods in different areas—could be "notice in manner for the time being required by law."

In Clause 7 an amendment was introduced relieving the rating authority from having to describe the property in the demand note.

In Clause 9 the Minister moved an amendment which was carried by which precepts to be issued by county councils instead of being subject to the section "as from the appointed day" shall not come within it until the valuations are completed in 1929. A further amendment was accepted to meet with the case of lateness on the part of rating authorities providing that where the amount due under a receipt was not paid by the specified date the rating authority might require the rating authority to pay interest at 6 per cent. on the amount overdue.

In Clause 11 an amendment was introduced enabling owners who collect and pay the rates under that clause to claim the 10 per cent. rebate if they pay the amount due within half the period in respect of which the rate is made payable, where the rate is payable in instalments, within half the period in respect of which the instalment is payable, but a more important point was the statement made by the Minister that owner occupiers should be given the benefit of the section, for he had found that where a local authority owned houses, where there was a rebate it was passed on to the tenants, and therefore as the clause stood it gave a pre-

ference to tenants of municipalities which the owner occupier could not claim. Certain amendments were also introduced into Clause 12 sub-clause (2) by the Minister which it is unnecessary to detail here.

In Clause 15 an amendment was introduced declaring that where the rates are in arrear the only persons other than the rated occupier on whom the rating authority can call under the section are the tenant or lodger of the person in arrear. Under Part II of the Bill a most important amendment was carried, on the motion of Major Ruggles-Brise, by a majority of 162, by which in Clause 17 sub-clause (5), which includes in every assessment committee two persons who are commissioners for the general purposes of the Income Tax, the inclusion of these persons was omitted. This marks the last trace of the uniformity idea.

In connection with Clause 21, which leaves the particulars to be inserted in the valuation list to be prescribed, the Minister gave an assurance that among the particulars to be prescribed would be the gross value of a hereditament where there was a gross value, the rateable value, and where the net annual value was different from the rateable value, the net annual value also.

An amendment was made in Clause 22 (Ascertainment of Rateable Value) which is not easy to follow in the report, but apparently words were added which would provide for a class of hereditaments subject to any rate, charge, or assessment made by any commissioners of sewers or like authority in respect of any drainage or other work for the benefit of the hereditament.

A drafting amendment was made in Clause 22 (1) (b) and sub-clause (3) was amended to provide that the net annual value or the rateable value should be calculated to the nearest pound. A drafting amendment was also made in Clause 23.

Possibly the main interest in all the proceedings "on Report" centred on Clause 24 which relates to the rating of machinery, as in Committee it had been promised that this clause should be left to a free vote of the House. There can be no doubt that the clause as framed by the Government is an immense improvement on the very complicated provisions suggested by the Departmental Committee which we noted in our issue April 17, 1925, and then considered far too complicated and meticulous to be incorporated in any Act of Parliament, but it has the advantage of embodying the main principle the Departmental Committee intimated should be acted upon, and it is very probably the best part of the Bill. The amendment to leave out the clause was defeated on the free vote by a majority of 218.

Town Planning.

The second of two lectures on "Town Planning" was given at the College of Estate Management on November 24 by Mr. Raymond Unwin, who emphasised the necessity for a civic survey of the existing conditions of a town before an attempt is made to prepare a scheme for development. He showed how maps may be used to illustrate the information so obtained, and for this purpose gave slides depicting the density of population, disease rates, zoning, time of travel from town centre, and land values. In regard to the traffic problem, he stated that in the last forty years the number of passengers travelling and the number of journeys per head had both increased at a rate far greater than the square of the population; any attempt to reduce travelling by the erection of abnormally high buildings, as in some parts of New York, must result in extreme congestion when such buildings emptied. In London, we required better co-ordination of traffic, a point to which greater attention had been given in the States. The radial roads of a town should not converge upon one focal point, but before entering the built-up area should branch in such a way that congestion at any point might be avoided.

ECCLES HOUSING

At the Manchester Assize Courts, before the Vice Chancellor of the Palatine Chancery Court (Mr. Courthope Wilson, K.C.), the trial has begun of two actions brought by the Eccles Corporation against Wooller and Sons and Thomas Moore and Sons (Eccles), Ltd., who both carry on business as builders at Eccles. Mr. T. Eastham, K.C., and Mr. H. Broadbent appeared for the Corporation and Mr. C. Atkinson, K.C., M.P., and Mr. J. Bennett represented the defendants.

Mr. Eastham (according to a report in the *Manchester Guardian*) said both actions involved the same point and arose out of a scheme for the construction of houses on the Anson Street (now Westwood Park) site at Eccles. Approval was given by the Ministry of Health in the early part of 1920, and tenders were accepted from Messrs. Wooller for 42 houses and from Messrs. Moore for 57 houses and 14 houses, those being the first three lots. A few days later the defendants informed the Town Clerk that they had made errors in pricing out the quantities, and when these had been corrected there would be considerable additions to the amounts of the tenders. Mr. C. H. Adkinson, the Assistant Housing Commissioner for the "C" region (Lancashire and Cheshire), told them that their tenders were too high and must be reduced.

On May 12 an interview took place between representatives of the defendants and Mr. Alfred Jenkins, an assistant surveyor, employed by the Ministry of Health, who suggested that they should pool their plant, take on the whole scheme amounting to 657 houses, and divide the contract. They then offered to do the work at £872 for houses in class "A," and £1,000 for houses in classes "B" and "B4," on the basis of certain modifications of the original quantities, which modifications were embodied in a schedule. Other modifications were suggested by the Housing Commissioner and embodied in a second schedule. According to the plaintiffs it was agreed that the prices should be reduced if these modifications were made, as the work would be done more cheaply. The difference might be £55 per house, possibly more.

On June 23, 1920, two contracts under seal were executed, one with Messrs. Wooller for 329 houses and the other with Messrs. Moore for 328 houses at the prices named, and these contracts stated that the schedules were to be construed as one with the original bills of quantities. Building operations began at the end of June, 1920, and the houses were finished in 1923. In January, 1922, the architect began to make out his monthly assessments for certificates on the basis of the reductions justified by the modifications in the second schedule, and the defendants objected. Their contention was that the prices had been fixed taking into consideration all the modifications.

The plaintiffs' case was that the deed was worded incorrectly and described the schedules as though their sole function was to reduce the amount of work to be done without altering the prices, whereas the second schedule was framed after the prices had been fixed, and was to be construed for the purpose of ascertaining how much less work was to be done and how much less money was to be paid. In these proceedings the Corporation asked the Court to rectify the deeds so as to embody the real agreement; and the defendants counter-claimed in respect of the deductions which they said had been wrongly made. Messrs. Wooller claimed £19,232 for deductions, £1,250 for interest to December 31, 1923, and interest at 1 per cent. above Bank rate from that date. Messrs. Moore claimed £19,255 for deductions, £1,212 for interest to December 31, 1923, and interest at 1 per cent. above Bank rate from that date.

The trial was adjourned to a day to be fixed.

THE ORGANISATION OF A BUILDER'S BUSINESS

In the course of a paper on this subject, given on Monday evening last at the Northern Polytechnic, Mr. Roland B. Chessum compared a builder's business organisation with a genealogical tree. To begin with, the head of the business was called the Chairman of Directors, or principal, or senior partner of a firm. He, with or without a Board of Directors, was the person to whom all information and records ultimately came, through the various sub-divisions, right up from the actual operations. Under him there might be one or two directors who took up certain sections of the work, but there were four important sections which had to be well looked after: (1) General office accountancy and finance; (2) costing, estimating and surveyors' department; (3) general indoor management; (4) general outdoor management. Each of these sections was again comprised of various duties. For example, under item (1) "General office accountancy and finance," the individual in charge had to see that the clerks all had their routine duties clearly set out and carried them out. The work consisted of the general books used in accountancy, the cash book, bought ledger, purchase book, journals, analysis books, the receipt of and checking all invoices and accounts, the arranging for payment of the latter, the receipt of all records from the various jobs, using them in preparing the necessary records and checking the deliveries of materials therefrom; the dealing with the weekly cash, allotting the various sums to be paid on each job, checking the pay rolls, entering up the wages books and many other duties far too numerous to detail minutely in the time at his disposal. There was also the question of correspondence, the proper filling of same, together with copies of all letters sent, and the dealing with the post; the preparation of a monthly statement dealing with certain important necessary data for the consideration of the principals or directors. In the general office routine there was also the occasional necessity of assisting in the preparation of tenders by extending and checking the prices in the bills of quantities.

Dealing with item No. 2, immediately an inquiry for an estimate or bills of quantities had been received, it was necessary to obtain quotations for the current prices of the various materials required for the particular tender which, of course, were all peculiar to the situation of the work which was to be carried out. Unfortunately there was frequently far too short a time given to enable the work to be done without considerable pressure being cast upon the staff in this department in a builder's office. There was also the question of the analytical costing for the various work in the different trades which was being done from time to time, in order that the estimating staff might be fully conversant with the costs of production, and to guide them in their subsequent estimating. Periodically, usually monthly, a statement had to be prepared on each contract showing the value of works executed, and submitted to the architects with the application for a certificate. This was sometimes prepared in conjunction with the quantity surveyor, representing the architect and client, with a member of the builder's staff, or a surveyor employed by the builder, and the total costings, to the equivalent date, were used in comparison with the statements as a further check on the progress of the work in hand.

With regard to item No. 3, General Indoor Management and Buying, these duties devolved on the member of the staff who was responsible for the supervision of the whole of the operations carried on at the contractor's works or depot. The duties in this section consisted of receiving the requisitions for materials or for manufactured goods (such as joinery, masons' work, engineers' work, &c., or other departments), which might be manufactured at the depot, and arranging for their due delivery to the respective works in hand. It was arranged that the requisitions for work to be done in the various departments always came in on distinctive requisition forms, so that they could be passed, after checking with the quantities, to

the foreman or person in charge of the respective departments with the necessary instructions. All other materials were either supplied direct from the merchant or manufacturer, or from stock. The duty of buyer was, therefore, placed with this individual, in order that he might be responsible for the whole of the supplies which were required for the jobs to which the respective requisitions referred. He had also to arrange for the necessary transport either by own lorries or arranging for the hire of others.

Item No. 4, General Outdoor Management, was carried on, according to the amount of contracts in hand, by one or more individuals, who were continuously visiting the various jobs, arranging with the foreman the organisation and procedure of same, generally looking after the management by the foremen on the jobs, and seeing that the necessary foresight was used to ensure the various materials being at hand when required, and the necessary labour being engaged. By thus visiting one job after another, this individual was able to organise the co-ordination of the various contracts, so that plant and materials which were no longer required at a contract and could be removed, were moved direct from one job to another, and thus save the expense of twice handling and taking back to the depot which would otherwise occur.

In each of the departments, as equally with the various contracts, there was a foreman in charge, and where the volume of work involved was of sufficient magnitude, there was a time-keeper and perhaps a deputy-foreman, and in each craft a leading hand or ganger. The foreman, whether in the department or on the job, had to be responsible for recording the time of the men under his supervision, and the proper setting out of the work, the keeping of the records of the materials received in or sent from his department or job, the requisitioning of all materials, plant, &c., that he might require, checking the work as he proceeded, to see that it was being done in accordance with the instructions contained in the contract documents, taking his instructions from the architect or the clerk of the works for any variations that might be desired during the progress of the work, making out all daywork sheets for work that had been done daywork. The same fundamental principle of organisation on the basis of the chart or genealogical tree applied equally in departments or on the jobs as in the office administration. As the general heads of departments or sections at the depot had different members of the staff in groups working under those responsible for the respective sections, the head of which supervised the whole and collected the necessary data and records, so on the jobs or in the departments the foreman at the head of that section had to arrange to group those under him in such order that he could have the assistance of a subordinate, a charge-hand or deputy, who was able to direct, instruct, and control the individual who did the actual work of production.

To give a minute description of all the details of the work in a contractor's business would be impossible on such an occasion as that, and, in fact, would occupy a considerable volume of time, and should be accompanied by diagrams and charts in order to explain it fully to those who were not already familiar with the practice.

There was one thing out of all others that was necessary to success, and that was a love of the job undertaken in life. Whilst at school and at technical classes early determination to learn the "why" in everything one did in connection with one's daily work would be found to be one of the most valuable aids in one's future career. Mr. Chessum advised his hearers to realise that at school the training was only a means to an end. Although the syllabus of the school might not include all methods which were in actual practice in a builder's office, it did include subjects from which useful conclusions might be drawn in the same way as Latin was a help to the acquisition of other languages. He advised them to learn to be master of as many jobs as they could, so that they might be able to control by having the knowledge how to do a job and

how long it should take, and be able to say the never asked a man to do a job that they could not do or had not done themselves.

TOWN PLANNING

THE Minister of Health has addressed a circular letter to county councils, and also to local authorities, on town planning. The chief points of the former are:—

One of the principal objects of town planning is to make provision for new roads and the widenings of existing roads, together with rebuilding or improvement lines, in order to meet the requirements of future traffic, and to reserve the necessary land for this purpose before development or redevelopment takes place while there is still time to do so with economy. To enable this to be done satisfactorily and effectively in the case of projected main roads and main road improvements, it is essential, not only that the County Councils should be consulted, but that they should take an active part in determining the proposals to be included for these purposes in any town planning scheme for areas within the county. It is important, moreover, if road plans for the county are to be prepared to the best advantage, that they should also be connected with neighbouring proposals in adjacent counties or county boroughs, and that there should be co-operation between the respective Councils in order to secure a properly related and satisfactory road system as a whole. For prescribing building or improvement lines along main roads, there is often no readier means at a County Council's disposal than that afforded by collaboration with town planning authorities. County Councils will appreciate in this connection the importance of the earliest consultation between their officials and the Divisional Road Engineers of the Ministry of Transport in planning any projected road improvements. In order that town planning authorities may be enabled to prepare schemes which adequately meet the future needs of the county as well as of their own separate districts, it is important that they should know whether and to what extent the County Councils are prepared to undertake responsibility for suggested improvements on main roads and the construction and maintenance of proposed new roads which by their importance have a fair claim to be "mainlined." Where the proposals to be included in a scheme (after full consultation with the County Council) are wholly or partly for the benefit of the main road system of the county, it is desirable that the County Council should clearly indicate to the town planning authority at the earliest possible moment that they are prepared to undertake responsibility to the extent of the benefit. Where new roads or widenings included in a town planning scheme are proposed to be undertaken at once, or soon after the approval of the scheme, the powers of the County Councils as highway authorities will be sufficient to enable them to make the necessary arrangements for meeting any expenditure which can properly be borne by them. Expenditure on account of claims for compensation, or excess cost of construction at the time of private development, does not often arise, and is not generally serious, where extensive interference with existing buildings is avoided, especially if, as is desirable, the owners concerned are consulted before the plan is settled, and the lines of the roads adjusted so far as reasonably practicable to meet their views. County Councils will, no doubt, consider it right that they should accept responsibility for their share of the expenditure above referred to, when it is incurred for the benefit of the county road system; and the Minister trusts that they will co-operate as far as possible by the use of their powers as highway authorities, and also the powers of sections 3 and 34 of the Public Health Act, 1925, and section 5 of the Roads Improvement Act, 1925. The Minister hopes, therefore, that there will be the closest co-operation between County Councils and any local authorities preparing town planning schemes.

The circular to local authorities may be summarised in the following extracts:—

The Town Planning Regulations already pro-

that County Councils shall be notified of proposals of town planning authorities affecting in county districts at various stages in the preparation of town planning schemes. In view, however, of the close interest of County Councils in town planning schemes, the Minister of Health considers that it will be an advantage that any County Council concerned shall be consulted; their co-operation sought, before town planning proposals are prepared for land either in a county district or in proximity thereto, that, where land within a county district is proposed to be included in any town planning scheme, the County Council should be approached before it is decided what the town planning area shall be. Section 21 of the Town Planning Act, 1925, preserves the operation of schemes, orders and regulations made under any enactments repealed by the Act, but any fresh resolution of local authority deciding to prepare a town planning scheme should now be passed under section 2 of the new Act. It will be observed that the provisions of sub-section (2) of section 10 of the Act (which relate to compensation on account of buildings erected or work done subsequent to the passing of a town planning scheme) are not to affect a purchaser of land as the resolution has been registered, if so required, under any enactment subsequently enacted providing for the registration of local land charges. Provision has now been made for such registration in Part VI (Section 15) of the Land Charges Act, 1925, and a Circular has been addressed to Local Authorities on this subject. It is now incumbent on every local authority or local committee of local authorities, which is preparing a town planning scheme to consider that provision ought to be included for the reservation of land for allotments, after obtaining report from their Allotments Committee. If part of the district of a neighbouring borough or urban district is included in the scheme, the Council of that authority has to be consulted, and they also have to obtain a report from their Allotments Committee. The Minister is to take this opportunity of reminding the Councils of boroughs and urban districts with a population of over 20,000 at the last census that they are required to submit schemes to him before January 1, 1929, for any land in their jurisdiction which is subject to town planning. Councils who are not already preparing schemes for parts of their area for which schemes are required should therefore undertake the necessary preliminary surveys soon, with a view to adopting plans and taking the initial steps to carry them in schemes. Copies of these circulars may be purchased through any bookseller, or directly from H.M. Stationery Office, Adastral House, Kingsway, London, E.C. 4, and all branches.

The Institute of Builders.

The Institute of Builders has just published a brochure setting forth its position in the building industry, its history, constitution, objects and conditions of membership. The aims of the Institute may be summarised as follows:—To promote excellence in the construction of buildings and honourable conduct of business; to develop technical education for the industry by providing lectures for this purpose, by testing the competence of persons in the industry to enter the industry, and by awarding certificates, distinctions, scholarships, prizes, etc.; to encourage and discover inventions for use in the industry; to establish a library to diffuse among members information of interest; to promote sound legislation; to co-operate with other bodies matters affecting the industry; to arrange standard forms of contract; and to encourage the settlement of disputes by arbitration and to nominate arbitrators. Membership is divided into three grades, namely, Fellows, Associates and Licentiates, who are entitled to use the distinguishing letters F.I.O.B., A.I.O.B., and L.I.O.B. respectively. Candidates for membership must proceed by way of Licentiate, for which they must be over nineteen years of age and have passed the Institute's Licentiate examination.

PUBLIC WORKS CONGRESS

We give hereunder our concluding reports of papers read at this Congress, recently held at the Agricultural Hall, Islington.

The Strengthening of Bridges.

This paper was prepared by Mr. C. G. MITCHELL, B.Sc. (Eng.), A.M.Inst.C.E., and Mr. C. S. CHETTER, B.Sc. (Eng.), A.M.Inst.C.E., both of the Roads Department, Ministry of Transport. They said that it was rare that the question of strengthening an existing road bridge arose apart from that of widening. Generally the decision lay between the widening and strengthening of the existing bridge, and its total replacement by a wider and stronger modern bridge. In many cases where the old bridge was of great artistic or historical value it was possible to find an equally convenient site elsewhere upon which an entirely new bridge could be built, leaving the old structure, adequately strengthened, to carry rigorously restricted traffic or to serve as a footway. As an alternative it might be decided to effect substantial widening and strengthening. Sometimes cantilevered footways would meet the case, although this would add to the dead and live load on the old structure. No further widening might then be required. A difficulty sometimes arose where the existing footways were thrown into the carriageway in that the surcharge from wheel loads on the spandrel walls was greatly increased. As a general rule where the existing bridge was narrow and could not be economically strengthened it was far better to demolish it and build a new and wider structure, and this rule should only be broken where the existing bridge was noteworthy for its beauty or antiquity. If the bridge was of no special value, historically or architecturally, the

question became purely one of engineering. It must be decided whether it would be cheaper to strengthen and widen the old bridge, or to build a new one. In this connection maintenance costs should be considered.

Regional Planning and Road Development.

Mr. H. H. HUMPHRIES, M.Inst.C.E., City Engineer and Surveyor of Birmingham, in the course of a paper on this subject, said it was a matter of paramount importance that the planning of extensive areas should be undertaken, extending and co-ordinating the Town Planning Schemes of the various authorities within it. Thus would be produced one comprehensive and coherent scheme for the whole of a region which, owing to its geographical and physical features, had such important matters in common as those above mentioned conjoined to mutual manufacturing, trading and business interests. The requirements for modern arterial roads to cope with the traffic must include provisions to enable it to travel both fast and safely, and they would appear to consist of the planning of the most direct routes, sufficient widths, capacious enough to accommodate all kinds of traffic, special facilities for fast traffic to travel safely, provisions for the safety of crossing traffic and pedestrians, well sign-posted, all mains accommodated under footpaths, easy gradients and good alignment with long curves and specially planned junctions, the road being widened out at curves and at quick junctions, sound, dry foundations and abutments capable of keeping the surface up to its work, a hard wearing waterproof and weather proof and, as far as possible, non-slippery surface with sufficient gradient, and but enough camber to drain properly, banked at curves of less than 1,000 ft. radius, and capable of being easily and economically cleansed, combined economical

COMPARISON OF PRICES OF BUILDING MATERIALS IN NOVEMBER, 1925, WITH CURRENT PRICES.

construction and maintenance suitable for the work expected of it, amenities attached to the route to be preserved as far as possible and extended to provide some parkway effects throughout.

Gradients.—The establishment of maximum and minimum gradients for new arterial routes, to be only departed from under exceptional circumstances, was important when the effect upon transport was considered. While a maximum gradient of 1 in 30 was most desirable, special efforts should be made when that was impossible to limit it to 1 in 25. As regards the minimum gradient, nothing less than about 1 in 300 was advisable, for it was important that lengthened saturation of the road surface should be avoided. The Arterial Roads and Main Drainage Committee of the Midland Regional Advisory Council were advising that Council to adopt the following widths of roads in connection with the regional planning:—Main arterial roads and secondary ones of great importance, 120 ft.; secondary arterial roads, 80 ft.; and through communication roads, other than arterial routes, 65 ft.

Modern Methods of House Construction.

Mr. Percy Morris (the City Housing Architect of Wakefield), who delivered this paper, said that the problem with which we were faced was to provide quickly for a considerable proportion of this nation convenient homes of a good standard of construction and design in pleasant surroundings, in particular for those who could not pay what was termed an economic rent. To overcome the immediate difficulty, it would be necessary in most industrial areas throughout the country to adopt other types of construction for dwelling houses. Of the forms and methods of house building now upon the market, probably some form of concrete construction provided the next best solution of the problem. There were, however, many dangers and pitfalls to be avoided, chief amongst which was that relief in one particular trade might result in overloading the work in another trade where the shortage of labour was just as acute. For example, relief in the bricklaying trade might be secured by the adoption of the pier and panel system of concrete construction, but the work required from the plastering trade was increased.

To name a few methods of concrete construction: We had the "in situ" methods, the pier and panel method of "in situ" piers with pre-cast slab panels, pre-cast framing, with pre-cast in-filling, or with "in situ" in-filling. Further, we had methods of construction of steel or wood framing with either a concrete cover or in-filling. It was realised also in practice that for economy in labour, cost and speed of erection, the 4 in. concrete building blocks of a convenient size, built as a continuous cavity wall, were comparable to most of the special systems yet on the market, and was one of the most satisfactory methods of building in concrete on traditional lines. In the manufacture of concrete building blocks on a small scale, it was found that the cost of the considerable manual labour involved made an unfavourable comparison with the cost at which bricks should be procurable. It would be far better that a plant should be put down for the manufacture on a large scale of slabs or blocks on mass production lines for co-operative use in areas where the supply of bricks was not sufficient to keep the procurable bricklayers fully employed; this should result in the production of a satisfactory concrete building material at a price comparable with the price of bricks. Mr. Morris gave some explanatory notes, illustrated by a diagram, of a suitable plant prepared in consultation with Messrs. Winget, Ltd., for the rapid manufacture of concrete slabs and blocks for distribution by either rail or road.

In considering any permanent substitute for the ordinary bedded brick or block wall lined with plaster, there were two definite conditions which must be fulfilled if success was to be secured; (1) The outside coating should be durable, and its durability not dependent on frequent coating, painting, &c.; (2) the inside face should have low conductivity and be sufficiently absorbent to avoid condensation, sufficiently smooth and free from crevices not

to provide harbourage for insects, and sufficiently hard and strong to resist attacks by mice and vermin and breakage by reasonable accident.

Timber framed houses had been erected on the Lupset Estate by the Wakefield Corporation, with the panels fitted with natural stone, having the internal face coated with a thin bituminous compound and a plywood lining divided into panels, with oak cover slips. The oak framing was carried out in English oak and the panels were oolite limestone from Ketton. In further houses, instead of a panelled interior, the plywood lining was prepared with fine butt joints, to which wall paper was applied throughout the houses. A further modification had been made with the external in-filling to the oak framing, the panels being formed of a "re-made" stone composed of the dissevered aggregate and matrix or the original oolitic stone formation, to which has been added a small proportion of Portland cement, forming an impervious stone of pleasing colour and having good insulating qualities.

The "Winget" pier and panel system of construction had been adopted with success, and contracts had already been let for 400 houses on the same estate. The system of construction was briefly as follows: The slabs formed the shuttering for the piers, which were formed of "in situ" concrete, dispensing with timber shuttering. The corner blocks were of a special shape with centre arc holes and channels for the "in situ" concrete, and were laid dry and plumb. To these angle blocks were laid the slabs, whose ends were shaped and rebated to receive slips of asbestos sheeting, 3½ in. wide. These pugging strips served to keep the slabs at the proper distance apart, and, in addition, formed part of the shutter for the poured concrete piers. The top or male edge of the slabs had two shallow recesses to receive the looped ends of wire galvanised ties, which were nailed down to the clinker breeze slabs, thus keeping the slabs up to the pugging pieces. The slabs were laid dry, and as each two or three courses were placed in position, the pier space between the pugging strips was filled in with "in situ" concrete and reinforced. The ends of the slabs were firmly and permanently held, the pier by a locking joint. At the first floor height and at roof height, 3 in. lacing courses of "in situ" concrete with suitable reinforcement were run all round the building, the reinforcement being looped and engaged with the reinforcing rods at each corner of the building. To bridge over the cavity between the outer and inner slabs, strips of asbestos were laid to serve as centering. The external face of the blocks was finished with a one-coat pebble dash roughcast, but the work required to be executed by the plastering trades was increased by this. It was thought that a development of this system of construction would enable the completion of both the external and internal face with a minimum of plasterers' labour. The slabs were manufactured in the same way as before except a three-quarters clean washed sand, or an oolitic sand face was formed in the mould. The construction was similar, except in this case the blocks were bedded. The finished work gave a pleasing appearance, and was strong, durable, and satisfactory.

The "in situ" concrete system of construction provided a method of wall construction which could be carried out by unskilled labour. The shuttering presented the greatest difficulty, both in erection and adaptation, to secure good alignment with plumb angles and the proper filling of concrete under window sills, &c.

Corolite was a form of monolithic poured "in situ" concrete, known and practised in Holland under the names of Korrel-beton. Its characteristic was that voids of comparatively large size were deliberately formed by screening out all material from the aggregate below ½ in. or ¾ in. and using up to about 1 in. of furnace clinker, slag, or other inert porous material in the proportions of 8 parts of aggregate to 1 part of cement with sufficient water to cause even distribution of the cement over all surfaces of the aggregate and leaving no mortar. The mixture was placed evenly and without heavy ramming between specially light shuttering, one story at each pouring, the resultant concrete being extremely porous, up to 40 per

cent. voids. The material was light, weighing 50 lbs. per foot cube, but was sufficiently strong for house building purposes. It was claimed that although the voids were so large the penetration of moisture in the horizontal direction was prevented, and on the outer and inner surfaces of the walls was sealed with a non-moisture holding coat, for example, Portland cement roughcast rendering, the walls were impervious to moisture and almost sound resisting. The reason also made that capillarity was defeated by reason of the relatively large size and frequent occurrence of voids, it being advanced by patentees that moisture could only pass through small pores, in opposition to gravity, and capillary attraction, and that when the voids reached certain size capillarity did not take place; this was the reason why damp courses were omitted in this method. The shuttering used was formed of hollow wooden frames, the inner edges rebated, made of standard width and of a height equal to the full height of the room; for both sides of any wall or partition metal spacers were used to maintain the inner and outer shuttering apart at a distance equal to the thickness of the outer wall of 8 in. the partition of 4 in., as the case might be. The shuttering frames were up the door and window frames were fixed, sheet metal panes were fitted to the rebates mentioned and held by angle irons that were themselves wedged up by a clip that acted in several directions at once. The advantages of light weight, sound proof, and cheap reinforced concrete floors had been obtained in this system by utilising frames of the wall shuttering to support floor shuttering, some, if not all, of which frames were left in until the concrete was capable of carrying its load; the metal pans, however, were removed from the surfaces, outwardly generally about 48 hours after pouring, and were used over and over again, as was every part of the shuttering. This method could be adopted for flat roofs, cheapening the cost by minimising the labour in all trades. No bricklayers, masons, or, when flat roofs were adopted, slaters, were necessary.

The special feature of the Rogers system was the reinforcement, which took the form of sheets of sheet steel stamped to form "wing" or "tangs," four in each square of 6 in., pressed outwards and two inwards. The advantages claimed were strength and economical use inasmuch as concrete could be placed from both sides simultaneously and yet kept distinct, which made it possible to place an impervious gravel rock or other form of weathering concrete on the outside and a porous breeze concrete on the inside to prevent condensation. The tangs of the reinforcement helped to support the concrete, enabling the sliding shuttering to be raised quickly. This system necessitated the erection of a special form of scaffolding to afford facilities for guiding the sliding shuttering. The internal face of the wall was plastered and the external face roughcast in the house erected at Wakefield. The whole of the wall including the shuttering, could be erected by unskilled labour under the control of a skilled carpenter.

In all the systems described, with the exception of different methods of ceilings, ordinary plaster had been the internal finish, but the most serious obstacle to any scheme for quick building was the shortage of labour in the plastering trade. Various substitutes for ceilings had been tried, all of which are generally satisfactory, but as yet nothing better or cheaper had been put on to the market than lime plaster. The most urgent requirement for all types of houses was the perfection of a suitable material having thermal and vermin resisting qualities to take the place of plaster. As there was practically no advantage if this material had to be applied as a plaster in the ordinary way, it followed also that some method of building must be designed to avoid this.

A new form of building had been evolved and developed by Messrs. Foundation Co., Ltd., London. The framework was of pre-cast synthetic stone columns suitably reinforced in one length; these were tied together at the first floor and roof plate level with stout beam

ported upon ledges cast upon and bolted to columns, which, in addition to giving a rigid work, provided supports for the floor and joists. The in-filling to the framework of weather resisting, compressed thin outer inner slabs of Ketton re-constructed stone, a filling between of cellular or ordinary "bitu" concrete poured after the slabs had put into place; this formed the main wall.

Discussion.

FRANK MASON, M.Inst.C.E., F.S.I., President of the Institution of Municipal and City Engineers, and Engineer and Surveyor of Wakefield Rural District Council, presided. The Chairman read a letter from Mr. A. M. (surveyor to the Honiton Rural District Council), who expressed the view that local authorities should first build houses for the poor people, and not attempt the erection of others until they had done this. An A3 house could be built at a cost of £400, including loan and property charges, and let for 10s. per week. This had been done at Honiton Rural District Council. They should build for people with an income of £3 5s. per week, as these could be assisted to have houses under the 1923 Act.

COUNCILLOR T. B. WEL (Wakefield) regretted a paper of such importance was being taken at a stage of the Congress. Housing, he was the channel through which would the other reforms such as town-planning, agreed with Mr. Morris that we must pay attention to the balance of the crafts in the country. We must regard housing as a public duty in the direction of public health and service, instead of in the light of profit and rents. He hoped that as municipal authorities they would utilise their powers under the 1923 Act, and work in the direction of building by brick on mass production lines the help of the apprenticeship system.

MR. F. MARSDEN (city engineer of Bradford) what was included in the net costs of the various methods as stated by Mr. Morris. All Mr. Marsden's experience at Bradford bore Mr. Morris's view that for durability nothing could beat brick-built or brick and stone-built houses. He thought that if one could put up houses on the principles used in most of the patent systems, they could be built just as quickly.

MR. G. FOSTER (Wakefield) agreed that better houses could be built than by brick alone. But other methods must be found which were unobtainable, and Mr. Morris helped his Council to use methods which proved, in the main, very satisfactory.

MR. G. H. S. ERWOOD (Chairman of the Wakefield Housing Committee) agreed that there was nothing to beat brick and stone houses, which he thought were the quickest to build. It was a question of organisation. We must organise the labour in the building trades. The play beds of the country should be controlled, whether through the municipalities or through Parliament: the production of all building materials should be controlled.

MR. A. G. ALINN (Chairman of the Southampton Housing Committee) stated that his Council had had tremendous difficulties in the plastering of brick houses. They had, however, been able to erect concrete houses, so far as appearance went they were quite as good as brick houses. What was more, the Council had been able to employ craftsmen to erect them that they could not have done with building, and to build two houses where they would not have been able to build one with brick.

At the end of the year there would not be a single family with two children in Northampton which would not be in a house to itself. The Council was also going to experiment with concrete houses. As to the cost, for the 1,500 houses the Council had built, this worked out at 10s. per week per £10 of assessment. He urged the authorities to try different methods.

In replying to the discussion, Mr. Morris said the costs referred to by Mr. Marsden included drains, paths, fencing and electric light, but not streets, sewers, or establishment costs.

NEW BUILDINGS IN LONDON.

Acton.—A nurses' home is to be built by the Governors of the Acton District Hospital at Gunnersbury-lane, W.3. Messrs. E. C. P. & H. Monson, architects, Finsbury Pavement House, A. Oargate, E.C.

Blackheath.—New manufacturing premises are being erected for Messrs. Burndebt Wireless, Ltd., Aldine House, Bedford-street, W.C.2. Messrs. Edwards Construction Co., Ltd., 86A, High-street, Eltham, S.E.9, builders. Messrs. Redpath, Brown & Co., Ltd., 3, Laurence Pountney Hill, E.C., 4, steelwork. Messrs. Bishop & Etherington-Smith, architects, 30, Duke-street, St. James's, S.W.1.

Bower-street.—Extensive alterations are to be made to premises in Bower-street, E., recently occupied by Dr. Barnardo's Homes, as a hostel. Messrs. Culpin & Bowers, architects, 27A, Bush-lane, E.C.4.

Camden Town.—Premises in Camden Town High-street, and Kentish Town-road, N.W., are to be compulsorily acquired by the London Electric & Metropolitan District Railway Co.s for enlargement and reconstruction of Camden Town Station.

Catford.—A contract is to be placed shortly for the building of the new church of St. John at Southend Village, S.E., for which plans have been prepared by Sir Charles Nicholson, Bart., 2, New-square, Lincoln's Inn, W.C. The cost is estimated at £35,000.

Charles-street.—Messrs. Imperial Airways, Ltd., Wolsey House, Piccadilly, W.1, propose to build new central offices—to be called Airways House. Building operations have been begun by Messrs. Rice & Son, 15, Stockwell-road, S.W.9, builders. Messrs. Powers & Deane-Ransomes, Ltd., steelwork, Cubitt Town, E.14.

Cheapside.—The Gramophone Co. are to open a new branch showroom, after alterations and putting in of shop fittings.

Chelsea.—The large building at the corner of Cheyne-walk, and Danvers-street, S.W.3, is to be adapted and enlarged to serve the purpose of a hostel for women. Messrs. Wratten & Godfrey, architects, 18, Queen Anne's Gate, S.W.1.

East Ham.—Mr. H. C. Horswill, 183, Green-street, Forest Gate, is the contractor for the new secondary school in Plashet-grove, which is being built by the East Ham B.C., at a cost of £40,000.

Edgware.—Messrs. MacFisheries, Ltd., propose to equip and open a new branch shop in Hale-lane. Plans by Premises Department, Lever House, Blackfriars Bridge, E.C.4.

Fenchurch-street.—The church of St. Katherine Coleman, E.C.3, the site of which has been acquired by Messrs. Lloyd's Register of Shipping, 71, Fenchurch-street, E.C.3, for building purposes, is to be demolished in the near future.

Grays.—Messrs. Brown Bros. (Grays), Ltd., Bridge-road, Grays, are building a large garage and repair shop in Argent-road. Messrs. Heenan & Froude, Ltd., steelwork, Blackfriars House, New Bridge-street, E.C.4. Mr. Harold Cane, architect, 11, Victoria-street, S.W.1.

Great Titchfield-street.—Messrs. Slater & Moberley, A. and F.R.I.B.A., 46, Berners-street, W.1, have prepared plans for the erection of a block of shops and offices. Messrs. Mullins & Lumsden, builders, Gresham Works, South Norwood, S.E.25.

Hackney.—A new factory is to be erected in Bentley-street, E., to the design of Mr. J. W. Codrington, F.R.I.B.A., 14, Bloomfield-avenue, Palmer's Green, N.13. Messrs. R. Maskall & Son, builders, 189, New North-road, N.1.

Hampton.—A new Wesleyan church is to be erected at a cost of about £4,000 to the designs of Mr. George E. Withers, F.R.I.B.A., 50, Cannon-street, E.C.4. Messrs. H. Somerford & Sons, 104, Manor-street, Clapham, S.W.4, builders.

Hart-street.—The four-story building at the

corner of Hart-street and Baxter-street, W.C.1, is to be entirely reconstructed. Mr. H. V. Clogg, builder, 81, Vallance-road, E.1.

High Holborn.—Messrs. Spreckley, Ltd., 21, Phoenix-place, W.C.1, are carrying out alterations to the "Old Crown" public house.

Holborn.—Messrs. Sabey & Son, builders, 100, Great Russell-street, W.C.2, have commenced the gutting of the interior of Embassy House, W.C., prior to its reconstruction, including additional floors.

Huntley-street.—The Royal Ear Hospital are erecting a new hospital on a site at the corner of Huntley-street and Pancras-street, W.C.1, at a cost of about £50,000. Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth-road, S.W.8, builders. Messrs. Edmund Wimperis & Simpson, architects, 61, South Molton-street, W.1.

King's Cross.—Plans have been approved for the erection of a two-story warehouse in Field-street, N.W.1, for Messrs. Hewitt Bros., printers' engineers. Mr. Max Clarke, F.R.I.B.A., architect, 20, Bedford-row, W.C.1.

Kingston.—Messrs. Jarvis & Richards, architects, 60, Tufton-street, Westminster, S.W., have prepared plans for new premises for the Governing Board of Tiffin Boys' Schools.

Kingston-on-Thames.—Plans are being completed and quantities prepared for the proposed nurses' home at the Institution of the Board of Guardians. Mr. F. Danby Smith, architect, Parliament Mansions, Victoria-street, S.W.1. The cost is £80,000, and 100 beds will be provided.

Lambeth.—The parishioners of St. Matthew's Church, New Kent-road, S.E.1, are raising funds for a restoration scheme. Plans have been prepared by Mr. Martin Travers, F.R.I.B.A., 25, St. Peter's-square.

Mortimer-street.—Early in January the whole of the west wing of the Middlesex Hospital, W.1, containing eight wards, will be closed for rebuilding, this being the first stage of the Hospital's £500,000 scheme. Mr. A. W. Hall, F.R.I.B.A., architect (Messrs. Young & Hall), 17, Southampton-street, W.C.1.

New Oxford-street.—Messrs. J. Lyons & Co.'s construction Department, Cadby Hall, Kensington, W., have demolished the front of the building at Nos. 36, 38, New Oxford-street, W.C., in order to instal new shop and display windows and interior restaurant equipment, it being the intention to re-open the premises as a branch cafe.

Oxford-street.—No. 100, Oxford-street, W.1 is being rebuilt to provide new showrooms and offices for Messrs. F. & C. Osler, Ltd., electric light fittings manufacturers. Messrs. Bovis, Ltd., builders, 43, Upper Berkeley-street, W.1. Messrs. Constantine & Vernon, 82, Mortimer-street, W.1, have designed a building of six floors.

Piccadilly.—The premises at the corner of Piccadilly and Brick-street, long the home of the Isthmian Club, have been acquired by the Green Park Hotel Co., Ltd., and are being rebuilt. The building is being practically gutted, and three stories are being added, and on the ground floor there will be a large restaurant, grill room, and lounge, &c. The work of excavating and underpinning, &c., is being carried out by Messrs. W. H. Lorden & Son, Ltd., contractors, Upper Tooting, S.W.17. Mr. Paul Hoffmann, Capel House, E.C.2, architect.

Regent-street.—The large block of shops and offices at the corner of Regent-street and Glasshouse-street, W.1, are shortly to be pulled down and a modern building erected. Messrs. North, Robin & Wilsdon, F.R.I.B.A., 35-39, Maddox-street, W.1, architects.

Regent-street.—Messrs. William Woodward & Sons, 15, Great James's-street, W.C., have been given sanction by the L.C.C., on behalf of Messrs. Lafayette, at 188-196, Regent-street, W.1, to erect a staff tea-room on the roof of Nos. 55-56, Kingly-street.

St. Pancras.—Financial arrangements are being completed in connection with the erection

of the proposed North-Western Polytechnic Institute. Mr. W. E. Riley, F.R.I.B.A., M.I.C.E. (Messrs. Riley & Glanfield), architect, 6, Raymond Buildings, Gray's Inn, W.C., estimates the cost of the building and equipment at £112,745.

Smith-square.—Good progress is being made with the building of the headquarters of the Transport and General Workers' Union. Messrs. David Colville & Co., Ltd., steelwork, 107, Old Broad-street, E.C.2. Messrs. Troy, contractors, Messrs. Culpin & Bowers, architects, 27A, Bush-ane, E.C.4.

Somers Town.—Plans have been prepared by Mr. A. J. Thomas, architect to the St. Pancras B.C., for new dwelling-houses, &c., on the Somers Town improvement area.

Southampton-row.—Demolition operations are being carried out on the site of the second section of the new headquarters in Southampton-row and Bloomsbury-square, W.C., for Messrs. Liverpool Victoria Friendly Society. Messrs. James Carmichael (Contractors), Ltd., Trinity-road, Wandsworth, S.W. Mr. C. W. Long, F.R.I.B.A., architect, 36, Bloomsbury-square, W.1. A nine-floored building is to be erected.

South Kensington.—A new geological museum is to be built on a site in Exhibition-road, S.W.7, whilst a new whale building is to be added to the Natural History Museum, H.M. Office of Works, architects, Storey's Gate, S.W.1.

Southwark.—The London Electric and Metropolitan District Rly. Co.s are to carry out various improvements at their Elephant and Castle station, S.E.1., including the construction of new subways and elevators, buildings, &c., to plans prepared by their engineers.

Stepney.—Messrs. Josephs, 2, Paul's Bake-house-court, E.C.4, are the architects for the building of a number of additional wards at the London Jewish Hospital, at Stepney Green, E.1.

Stratford.—A new factory is to be built in Shirley-street, E.15, for Messrs. Coombs, Bros. & Sons, Ltd., provision merchants, to plans prepared by Mr. G. N. Kent, Lic.R.I.B.A., 521, Barking-road, E.13.

Surbiton.—An extensive housing scheme is to be carried out at Tolworth. Messrs. Thoroughgood Bros. & Son, contractors, 55, Bond-road, Tolworth, Surbiton, S.W., for 50 houses, at £21,249.

Theobalds-road.—A housing scheme is to be carried out by the Essex County Building Co., Ltd. Messrs. Anthony Fasey & Co., Ltd., builders, Grove Green-yard, Leytonstone, E.11.

Trafalgar-square.—A plot of freehold land in Spring Gardens, S.W.1, is to be sold for building purposes by Messrs. Hampton & Sons, surveyors, 20, St. James's-square, W.1.

Wandsworth.—A new branch Post Office is to be erected on a vacant site at the Garrett-lane and Buckhold-road, S.W., under the supervision of H.M. Office of Works, Storey's Gate, S.W.1.

Watford.—Alterations and additions, including a new electric light installation, are to be made to the Police Station. Mr. A. J. Eldridge, builder, 198, Vicarage-road, Watford.

Welwyn.—Future developments at the Garden City include the lay-out of Central Parkway, along both frontages of which will be erected public buildings, including a cinema, hotel, bank, &c., and houses. Mr. Louis de Soissons, F.R.I.B.A., architect to the Garden City.

Willesden.—Building operations have now started under the additions to the Willesden Hospital in Harlesden-road, N.W.10. Plans for a new ward have been prepared by Messrs. Greenaway & Newberry, F.R.I.B.A., Parliament Mansions, Victoria-street, S.W.1. Messrs. G. Godson & Son, builders, 215, Kilburn-lane, Willesden, W.

Woolwich.—Messrs. Whincop & Channer, architects, 47, Thomas-street, Woolwich, S.E., have prepared plans for new premises at Nightingale Vale, S.E.

(For rates of wages in the Building Trade in Scotland, see page 829.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

Bathing Establishments.

In the course of a meeting of the Institution of Heating and Ventilating Engineers (Incorporated), held at the Shipping, Engineering, and Machinery Exhibition, Olympia, on December 2, Mr. J. E. Boaz, in the course of a paper on this subject, said the whole question in respect of the requirements of bathing establishments resolved itself into the proper application and utilisation of the heat generated. Baths could be divided into many categories, but might be classified as ablutionary, recreative, and curative or medicinal baths. Coming to the requirements of the various types of baths, which he sub-divided, it was first necessary to provide adequate service. Public baths were institutions which belonged to the community, and were built and maintained by public funds. It was therefore obvious that the fullest consideration should be given to economy in running costs, as well as giving to the users of such establishments the very best service procurable. Dealing with the various types of baths, he considered the various plant required, and stated that in the present day newly-constructed swimming baths, provision was made for the installation of water purification plant for maintaining the water in a fit state for bathing. In such cases no provision need be allowed for the boiler plant, as in the old days, to heat the large bulk of water daily from cold, as the initial heating could be extended over a longer period than four to six hours ordinarily taken. The boiler plant need be only of sufficient power to provide for the daily heat loss of approximately six to eight degrees per day.

BERMONDSEY LONDON S.E.16.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

ALDRIDGE.—A committee has been formed to further the scheme for providing a memorial hall. A site for the building has been offered with a frontage to Rookery-lane.

BARKING TOWN.—Plans prepared by the surveyor have been approved for the erection of bandstand and shelters in parks, at a cost of £3,000. Plans are to be prepared for a new refreshment pavilion in the park.

BARNOL SWICK.—The Vicar of St. Mary le Gill is appealing for funds for a new church, which is estimated to cost £30,000. Plans prepared by Mr. R. Martin, Diocesan Architect, Manchester.

BARNLEY.—The Education Special Sub-Committee have considered plans of the proposed Mining College and Technical Institute prepared by Messrs. Briggs & Thornley, of Liverpool, which have been further amended to enlarge the Principal's Room and the Reference Library. They have decided to ask for a further alteration in the first floor plan respecting the cloak-rooms. Mr. H. T. Turner, architect, Westville-road, has prepared plans for the erection of a combined Chapel and Sunday School, for the local Wesleyan authorities, to be erected in Huddersfield-road. Tenders are to be invited.

BIRKENHEAD.—The B.E. has approved the erection of a new secondary school for girls on land off Park-road South, to cost £55,000. Plans by Rees & Holt, of Liverpool.

BIRMINGHAM.—The E.C. has accepted a tender for the erection of a school at Sattley, with accommodation for 500 children. The site is in Belchers-lane, and the cost is estimated at £51,069. The T.C. recommend that the proposed purchase by the Watch Committee of an area of land at the junction of War-lane and Fellows-lane, Harborne, to be used as a site for the erection of 212 houses for the police, be approved, and application be made to the M.H. for sanction to borrow. It is intended to erect 27 parlour type houses on this site.

BLACKBURN.—The Corporation has formulated a scheme for the improvement of Green Park, and the approach from New Wellington-street, and the reconstruction of the Canal bridge in Albion-street, the total cost being estimated at £10,600.

BLACKPOOL.—The C.B. passed plans: Eleven houses, Vicarage-lane, J. Marsh; business premises, Promenade and Bank Hey-street, F. W. Woolworth & Co., Ltd.; eight houses, North-drive, R. Brown & Sons; 20 houses, Hudson-road, Bradshaw & Turner; 23 houses, Powell-avenue, F. Holmes.

BOLTON.—The members of the Chorley Old-road Congregational Church are raising funds for the erection of new school buildings. The members of the Deane Church propose to erect a new vicarage and parochial hall.

BOLTON-UPON-DEARNE.—A plan for the erection of a mortuary has been approved subject to the market scheme being proceeded with.

BOSTON.—The B.D.C. are inviting the T.C. to join them in approaching the Witham Commissioners with a proposal for the construction of a dam across Bargate Drain at Cowbridge.

BOURNEMOUTH.—The M.H. has approved the acceptance of the tenders for the erection of 96 houses and maisonnettes on the Charminster-road site, and also the borrowing by the T.C. of £42,484 and £1,500 for the erection of the houses and road works in connection therewith.

BRAIFOR.—A new masonic hall is to be erected in Manningham-lane, to cost in all about £65,000. Plans have been prepared by Messrs. Ross & Briggs, Eldon Chambers, 75, Manningham-lane.

BROMLEY.—The E.C. has asked the T.C. to apply to the B.E. and the M.H. for preliminary approval to the proposal to erect a separate building for the purposes of the school clinic. The scheme is estimated to cost £1,850.

BURNHAM-ON-SEA.—The Rev. H. E. Wake, Vicar of Burnham-on-Sea, St. Peter's Church, is raising funds for the completion of the church, at a cost of about £2,000.

BURTONPORT.—The Donegal C.C. are proposing to rebuild the 11 dwellings at an estimated cost of £3,000.

CARLIFE.—The final plans for the proposed new schools for St. Josephs, The Heath, are now waiting for the approval of the B.E. The building is planned so as to accommodate 400 children and the architect is C. Bates, of Newport, Mon.

CARLISLE.—The U.D.C. has approved plans submitted by T. W. Lomas, for the erection of a village Hall at Aglionby.

CARLTON (YORKS).—Funds are being raised for the proposed erection of a United Methodist Church Sunday School in Ferry-lane.

CHAUDERTON.—The U.D.C. has approved plans and sections for the new generating station to be erected on the banks of the canal by the Oldham Corporation.

CAELMSFORD.—The E.C. recommend that plans for a new elementary school be approved, and that application be made for sanction to borrowing £23,600.

CERTSEY.—The R.D.C. has reported that F. W. Farris, builder, Acton, has acquired 19 acres of land in Pyrford-road.

CHICHESTER.—The West Sussex C.C. has approved the proposed erection of a secondary school for boys, at an estimated cost of £28,500.

CHORLEY.—The Corporation are preparing for the development of the housing site at Harrison-road. The Corporation has asked a committee to consider what improvements can be made in the Council Chamber to provide more satisfactory and healthy accommodation. A scheme is being prepared for the erection of houses adjoining The Ranglets. Messrs. Biram & Fletcher are to report as to the heating of the Highfield school and the provision of open-air class rooms.

CHURCH.—The U.D.C. have approved plans submitted by the Oswaldtwistle Council for the erection of a new rectory house.

CLADON.—South Shields R.D.C. are negotiating for fifteen acres for a housing scheme.

CLITHEROE.—The E.C. have approved a site in Brownlow-street for the erection of an upper standard school.

DERBY.—The management of the Derbyshire Children's Hospital are appealing for funds for the proposed extensions to the Children's Hospital. An appeal is being made for £3,000 to carry out repairs to the tower of All Saints' Church.

DONCASTER.—A housing scheme, embracing 1,000 dwellings, is to be carried out in South Elmsall, Hemsworth, South Kirby, &c., by the National Housing Corporation of Great Britain, Ltd., London, S.W. Plans are in the hands of Major Douglas Wood, F.R.I.B.A., 35, Craven-street, Strand, W.C.2.

DOUGLAS.—The Tynwald Court has approved a scheme recommended by the Isle of Man Harbour Commissioners to extend the breakwater at Douglas 800 ft., at an estimated cost of three-quarters of a million pounds.

DOVER.—It is proposed to carry out an extensive housing scheme at Tilmanstone Colliery, and to build about 1,000 houses, a market centre, &c. Plans have been prepared by Messrs. Ewart G. Culpin & R. S. Bowers, 27A, Bush-lane, E.C.4.

DUKINFIELD.—Members of the Town-lane Baptist Church are raising funds to meet the cost of the new Sunday School to be erected off Town-lane.

DURHAM.—The following relief schemes have been prepared by the Durham C.C.: New arterial road from Chester Dene to Longey-lane, estimate £310,310; new arterial road from Jingle Gate to proposed Hylton Bridge, estimate £240,860; new arterial road from Hylton Bridge to Seaham, estimate £335,336; and Blackwell Bridge reconstruction and road diversion, estimate £52,500.

EARBY.—The U.D.C. has submitted plans for the lay-out scheme providing for shops, houses and bungalows additional to 60 houses already sanctioned. **EARLSTOWN.**—New public baths are to be built, at a cost of £16,000. Plans, &c., by Mr. C. Cowles-Voysey, A.R.I.B.A., 14, Gray's Inn-square, W.C.1.

ECCELESFIELD (SHEFFIELD).—The proposed new church and lecture hall to be erected for the Methodists is estimated to cost £6,000, and additions are to be made later comprising Sunday School, class-rooms, and other buildings, at an additional cost of £2,500.

ELY.—The Isle of Ely E.C. has acquired a site upon which it is proposed to erect a new school.

FINGOLEY.—The M.H. has sanctioned a loan by the Middlesex E.C. of £29,700 for extensions at Christ's College. Sanction has been given to the Middlesex E.C. to borrow £9,234 for extensions at the Woodhouse secondary school.

WHITEHAVEN.—The old Whitehaven and West Cumberland Infirmary has been purchased privately by the Corporation for conversion into a school.

WILLES DEN.—The Health Committee of the U.D.C. are still holding a site on the Brentfield estate for the erection of a clinic.—The U.D.C. recommend that the engineer be instructed to arrange for the necessary redecoration of the Council chamber.—The Council are considering the question of inviting tenders for the erection of the remaining houses on the Brentfield estate.—The West Willemsden Ratepayers' Association are suggesting the erection of self-contained flats in preference to houses on the Brentfield estate.—Plans passed: Fifteen houses, Hanover-road, Brondesbury Park, by H. Shaw, for F. Hilborn; offices and stores, 307, 309 and 311, High-road, Kilburn, by H. Austen Hall, for The Gas Light & Coke Co.; additions, sanitary conveniences and alterations, electricity sub-station, Salusbury-road, Kilburn, by A. W. Blake, for the Electricity Committee; transformer house, Edgware-road, Cricklewood, by A. W. Blake, for the Electricity Committee.

WOLLS.—The B.E. has approved of the plans of the Surrey E.C. for adapting a hut, levelling and laying out grounds at the Country School for Girls, at a cost of £4,750; also for the erection of a junior mixed and infants' school at Westfield.

WOLVERHAMPTON.—The T.C. propose under the boundary extension scheme to acquire lands in the borough for the extension of the fire station, town hall, and other municipal purposes, and for the extension of the cattle market and abattoir.

WORCESTER.—The Infirmary Committee are contemplating building a new X-Ray department, at an estimated cost of £1,000.

WORTHING.—The West Sussex C.C. has approved the recommendation of the E.C. for £4,500, part of the £20,000 for additional accommodation at the Secondary School for Boys.

PATENTS.

APPLICATIONS PUBLISHED.*

235,837.—F. Himmel, and I. Himmel: Store-front construction.

237,975.—W. W. Love: Construction of framed buildings.

237,980.—E. Y. Robinson, E. J. E. Hubbard, and Metropolitan-Vickers Electrical Co., Ltd.: Method for securing metal to insulating material.

237,992.—C. L. Burdick: Means for washing and conditioning air supplied to buildings.

237,996.—E. G. Enticknap: Machine for manufacturing concrete blocks.

238,024.—R. Grierson, and Grierson, Ltd.: Electrical heating of rooms or buildings.

217,571.—A. F. Decker: Floor covering.

238,029.—R. W. de Montalk: Facing of concrete slabs and buildings.

238,112.—J. Parker: Roofing-tile.

238,136.—H. Hope & Sons, Ltd., and H. D. Hope: Steel doors.

237,304.—J. W. Thorpe, J. A. Bowden, and J. Taylor: Means for holding sliding doors and windows, in open, closed, or intermediate positions, and preventing rattling.

237,347.—J. R. Wade: Reinforced-concrete structures and removable reinforcements therefor.

237,380.—E. C. Caley, and C. Downs: Building of houses and other buildings or structures constructed of bricks, stones, and concrete blocks.

237,438.—G. W. Stokes: Centering of false-work used as temporary supports in the construction of concrete floors.

237,470.—C. Taylor: Domestic hot-water and like supply systems.

237,475.—G. E. Wight: Apparatus for use in the laying of bricks and similar elements in building.

237,483.—A. Nutter: Domestic fireplaces.

237,499.—F. H. Clark: Manufacture of roof felt.

228,508.—Etablissements Jaquetmet et Mesnet: Automatically operating curtains or shutters for isolating fires.

233,302.—C. H. Jucho Dortmund Bruckebau: Building structures.

The Inspection of Cranes.

In the House of Commons recently Mr. Cluse asked the Home Secretary how many inspectors were engaged in inspecting cranes used in building and other operations; and whether, seeing that cranes were responsible for a total of 3,093 accidents in 1924, including 76 fatal accidents, it was proposed to increase the number of inspectors and take other action to reduce the number of accidents due to cranes?

Mr. Locker Lampson said that the inspection of cranes formed part of the routine duty of the district staff, no inspectors being specially detailed for this work. The prevention of crane accidents had been receiving close attention and special steps had been taken and further steps were under consideration with a view to reducing the danger. For example, the provisions as to cranes in the Docks Regulations had been strengthened and similar requirements included in the new draft codes for the building and ship-building industries. Further, in order to guard against crane collapses which were a fruitful source of accidents, the British Engineering Standards Association had agreed, at the Home Office request, to prepare standard specifications for the construction and design of cranes. He was glad to see from the Chief Inspector's report that the standard of safety in regard to hoists was distinctly advancing throughout the country, but he agreed that further provision on the subject was desirable. The matter was being considered in connection with the Factory Bill.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

Steel Houses.

The suggestion of giving an increased subsidy towards steel houses and others manufactured by mass production methods, is not, we understand, proving to be very popular with local authorities. Another suggestion made with the object of providing cottage houses quickly without calling upon the depleted ranks of the building trade operatives, is at present under consideration. One of the difficulties that hampers firms who have systems for applying engineering methods to the housing problem is the cost of the necessary machinery needed for mass production.

Builders' Estates.

Mr. Jervis Veale, builder, of South Brent, Devon, has left net estate of £14,057.

Mr. G. T. Martin, contractor, of Carisbrook-road, Edgbaston, has left net estate of £13,476.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Upper Renfrewshire.—**HOUSES.**—The District Committee of Upper Renfrewshire propose to proceed with the erection of 500 houses. The houses are to be allocated as follows :—Thornliebank, 50; Busby, 60; Elderslie, 100; Neilston, 100; Nitshill, 100; and other areas 90.

Ayrshire.—**HOUSES.**—The Northern District Committee of Ayrshire C.C. has recommended the erection of 352 houses throughout seven parishes, and it was decided to proceed with the erection of the first hundred houses at once, these to be erected in parishes of Drghorn, Kilbirnie, and Stevenston. The hundred houses will be of the Dennis Wild system, and will be erected by Messrs. James Rome & Sons, builders Kilmarnock.

Hawick.—**LIBRARY.**—The Hawick Public Library Committee has resolved to adopt the open access system in the lending department, the cost of the alterations being estimated at £275.

Lennoxtown.—Houses.—The Western District Committee of Stirlingshire C.C. has decided to ask the Scottish Board of Health to sanction the erection of 20 steel houses at Lennoxtown and two at Milton of Campsie.

Paisley.—**HOUSES.**—The Dean of Guild Court approved plans for the erection of 57 blocks of houses on the Lochfield-road, for the Corporation.

Edinburgh.—**HOUSING.**—The Housing and Town-Planning Committee of the Town Council has recommended the purchase of thirty-two acres of ground on the Prestonfield estate, for the purpose of a new housing scheme.

Dundee.—**REPAIRS.**—Re-roofing parts of Dundee Central Baths is estimated by the city engineer to cost approximately £5,000.

Berwick.—THEATRE.—Messrs. Johnston & Darlings, Berwick, have accepted £2,000 from Berwick Theatre, Ltd., for their old premises in Hide Hill. A picture-house and theatre is now to be built on the site.

Leven.—HORSES.—The Leven Town Council has decided to erect 64 houses on the remaining 8½ acres of the 20 acre field in which they have been erecting houses.

Glasgow.—VARIOUS.—The Dean of Guild Court passed plans: St. Barnabas Episcopal Church, Dennistoun, hall, Craigpark; City Bakeries, Ltd., clubhouse at Helensburgh-drive, Jordanhill; Corporation Electricity Department, electricity sub-station at Finlay-drive; Corporation Gas Department, electricity sub-station at Crawford-street; Corporation Police Department, public halls at Charles-street and Summers-street, Fridgeton.

Lanarkshire.—Horses.—The Middle Ward District Committee of Lanarkshire approved a minute of the Housing Buildings Sub-committee relative to the construction of 1,500 houses sanctioned by the Board of Health. Arrangements are being made for borrowing the sum required to meet the cost of the houses, which is estimated at £720,000. The question of purchasing outright the Carfin brickworks at a cost of £10,000 is under consideration, and a recommendation to the County Council to this effect was approved.

Messrs. G. & J. Weir, Ltd., have produced a new type of steel house at a lower cost than previously.

The new house, known as the "Blanefield" is built in two-storied blocks of four and consists of three apartments, kitchenette, and bathroom.

The first of the new type has been erected at the firm's factory at Cardonald. The houses are quoted at £357.

The death has occurred at Huntley of Mr. James Morrison, builder.

The death has occurred at Langside House, 44, Mansion House-road, Glasgow, of Mr. Archibald Stewart, builder, in his 79th year.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

[illegible]

* The information given in this table is copyright. The rates or wages in the various towns in England and Wales are given on page 822.

DECEMBER 11, 1925

THE PERIL TO THE COUNTRYSIDE

WE have so many times in these columns called attention to and illustrated actual examples of the devastation of the countryside, often wholly unnecessary, that we are glad to see the concentrated attention now being bestowed on the subject. President of the R.I.B.A., in his recent address, referred to this national calamity, as when he said, "When we turn to our villages and country towns the position is not hopeful. Too often we see villages, whose rustic character is their chief charm and attraction, being spoiled by new buildings that ape the worst features of our city buildings and are intrinsically out of place. Yet all this is being done under the mistaken idea that progress is being made. The country possesses exquisite old villages and country towns, some of the most beautiful in the world. They are a unique and priceless heritage, the admiration and envy of all who visit our shores, that should be preserved at all costs; but to exaggerate to say that in half a century's time, the rate so-called improvements are being made, the destruction of almost all the beauty and distinction with which our ancestors enhanced these towns and villages will be complete."

Professor Abercrombie spoke to the same effect when at the Town-Planning Conference he told us, "The countryside is an even more pressing problem than civic planning. Our cities are already mostly ugly, but the country is still beautiful and in greater danger. What is lacking is any plan at all of landscape design, applicable to the ordinary countryside." And now we find a contemporary devoting two columns to the subject, under such titles as "How England is being spoiled," "Degrading the countryside," and more to the same effect; while in the article itself, Mr. Morley Horder gives detailed instances, and expresses some strong views on the subject, pointing out how regard for these things is the basis of a nation's culture, and of the dangerous symptoms of neglect of this foretells. He tells us also of an American friend who said to him:—"We come here because England is the most beautiful country in the world, and because we can see in her old towns and in her villages things that we can find nowhere else in the world; but every time we come we see less and less of these beautiful things, and more and more of a growing contempt for beauty, which we find very disgusting; if this spirit continues there will certainly be fewer Americans than tourists returning to the United States with affectionate and reverential memories of England."

It is well that we should sometimes regard what other people think, lest, wrapt in our own complacency, we lose sight of the reality of things. Outside opinion is not negligible, and there are those who would tell us that "England's days are numbered." We resist such an assumption with all the force of our nature, but not to hide from ourselves the dangers in which we live—nor the disquieting features in much that is around us—for in facing them we shall find the remedies, the necessary discipline, appreciation and new effort to bring the ancient hereditary England with the life of to-day. They can be re-united, though under new forms, if the spirit which guides them is actuated in a like way.

So we are, indeed, glad that the disfigurements and abuses which have been allowed to develop to an extent so alarming should now at last be receiving the attention they deserve, for in such case we are entitled to believe that amelioration is not so far off. The beauty of our country districts, attacked from all sides by the manufacturer, the road maker, the motor interests—even the builder at times—has involved an ever-growing disintegration of that rural and special beauty which is the characteristic of our beloved motherland. And it is most desirable while the matter is receiving the especial attention now bestowed upon it by authoritative opinion, that the subject should not be allowed to drop, until by legislation or whatever other means, local and central, the steps necessary for preservation of the rural and historical characteristics of England are adequately taken.

We are suspicious of arguments drawn from consideration of the material advantages that the attraction of a beautiful country has for the foreign visitor, and the injury to those interests lying in the mutilation and disfigurements of the countryside. Yet that this is the case, and that people of other nations are less attracted to our shores, as its traditional and rural characteristics are more and more impaired, cannot be doubted. But the most important view is that which directs the nation, for its own sake and out of love and pride in our inheritance, and the things which matter most, to preserve and carry on its most distinguishing and beautiful characteristics. The problem which, with the destruction now going on, most requires solution, is how to unite the ancient hereditary England with the life of to-day. Such re-union is possible, because though the terms of our present life and its requirements may differ superficially, underneath they are the same, so long as we are guided by those principles which give security to life and permanence to institutions. The Englishman is naturally conservative, only his conservatism too often comes out at the wrong end, so that it is directed to conserving the wrong things, the temporary advantages instead of the ultimate good. This one-sided commercial advantage and a too undisciplined freedom in pursuit of it, and the claim "to do what he likes with his own," narrows his conception of citizenship, and so weakens the national character. Now that we are thinking more in the terms of the nation, and of the public service owed by each of us to secure its well being, we may hope that this peril of the countryside will be the concern of everyone who cares for it, and that the evils which afflict us will gradually disappear.

For who has not witnessed with ever deepening regret the rapidly changing character of our small country towns and villages as the endeavour to ape the fashions of our larger cities actuates what they do? The front of the charming old house torn out, to be replaced by the only new shop front and its ephemeral merchandise, the advertisements which infect the street, the ugly surroundings of the garage—who but regrets these things? not that they are inevitable, but because they are unnecessary. Nor does prosperity lie that way, for, in the end we shall cease to enter these towns for our pleasure at all. So we are glad to think that a better outlook is before us, and that not yet too late the fair fame of our countryside may be gradually restored.

NOTES.

Solidarity in the Architectural Profession. Most of our readers know that the Royal Institute of British Architects has ever striven to promote professional solidarity among architects. A circular recently issued by the Institute announces that the Council have considered the representations made to the profession by the Incorporated Association of Architects and Surveyors, and they hasten to assure all members of the Institute and Allied Societies that nothing done by the Institute in promoting legislation for the registration of architects will affect detrimentally the interests of any person now living by the practice of architecture. To this we would direct the attention of all architects, whether members of the Institute or not. The circular concludes with these words: "Members of the R.I.B.A. or of the Allied Societies who help to establish independent architectural organisations are *not* assisting the cause of registration, but are dividing the profession and destroying the professional unity which has only just been achieved after many years of effort."

Waterloo Bridge. We must congratulate the L.C.C. on their wisdom in proposing to pass over the responsibility for Waterloo Bridge to the Government. The agitation for its preservation has been so sincere and far spread that everybody must now realise the value of the Bridge to the nation. It must be preserved and we cannot believe our engineers are incapable of the task. The bridge is one more of the instances of failure to anticipate the growing needs of city development. Can one believe that the designer of Waterloo Bridge would have built such a narrow bridge had he at all realised the coming needs of London? It is only in recent years that we have adequately realised the overwhelming claims of transport facilities. But the merest tyro in town-planning would know that if you allow the congestion of crowded city buildings to continue indefinitely a time must come when provision of ade-

quate transport becomes practically impossible. Yet we are still permitting great accumulations of crowded humanity, so as to add indefinitely to our transport difficulties. For the moment the L.C.C. appear to realise that the point at issue is not mainly the transport facilities to be offered by Waterloo Bridge, but its value as a national monument, and in this they are right.

Building Stones and Bricks. Mr. A. P. LAURIE, whose recent lecture at the Royal Academy of Arts excited much interest, has offered to conduct a series of tests upon lime stones by exposing them to acid vapour, if the Royal Institute of British Architects will collect samples for the purpose. He also suggests making similar experiments upon the various bricks in use, especially when the materials and mode of manufacture are known. These suggestions, if carried out, would be of great practical value to architects, who would be spared some of the risks attendant upon employing building materials of which they have had no previous experience. A correspondent informs us that unburnt bricks made with some kind of cement and sand have been used in the walls of houses erected by the London County Council in outlying districts. It would be interesting to know how such bricks are likely to stand the test of time, and Mr. Laurie's proposed acid test might help to solve this question.

Testing Concrete Blocks. The paper which Mr. H. G. Lloyd, M.Inst.C.E., read at the last meeting of the Institution of Structural Engineers on "A Method of Testing Concrete Blocks," an abstract of which we give on p. 850 was one of those practical contributions to knowledge which are made from time to time, and which are of great value to those interested—in this case, those engaged in the design of reinforced concrete structures. The paper was the sequel to a previous one by Mr. Lloyd on "The Consistency of Portland Cement, Mortar and Concrete," read before the Concrete Institute in 1920, and the object of the author was to describe the application of the principles described in

the previous paper to the testing of concrete and hence of concrete blocks. It may be recalled that Mr. Lloyd is a recognised expert on his subject, and was responsible for the introduction of Granuloid, a porous material that has been used very successfully for tennis courts.

Sky Signs and Architecture. THE President of the Architecture Club, in addressing the Manchester Luncheon Club on a recent occasion is reported to have suggested that commercial architect, "whoever it should take in hand the sky sign, make it beautiful. We confess to doubts as to the advantage of sky signs in relation to architecture, nor do we see that this sort of advertisement readily grow out of architectural requirements. Would it not be better for the sky sign retired to a field of its own? We suggest that if this form of advertisement has come to stay, it should be "parked" on ground of its own—the derelict White City could be redeveloped in order to furnish the opportunity for its display, instead of disfiguring prominent buildings. In this way architecture would be left free to pursue more legitimate aims. Nor are we that the gaiety added to the night of London by illuminated signs is the cost at which it is obtained. There are not even some comparisons between the value of the kind of building and this sort of display, and not supplementary to its character. A fine architecture would, we think, be its security against such disfigurement, as it improves the sky sign will form part of its design.

Smoke Abatement. WE welcome the evolution of its activities in the annual report of the Smoke Abatement League of Great Britain. This is one of those agencies of good which we hope will continue to receive continued and active support. The fight for an improved domestic atmosphere in our cities is one of the most careless and prejudice, and calls for all the forces both legal and moral that can be made use of. One wonder

The Kitchen Memorial, St. Paul's Cathedral.

MR. W. REID DICK, A.R.A., Sculptor.

the Kitchener Memorial, St. Paul's Cathedral.
MR. W. REID DICK, A.R.A., Sculptor.

the memory will carry of our wonderful when London seemed almost smoke—because we couldn't get coal fires. are glad to know that arrangements have been made for a Universal Smoke Statement Exhibition in Bingley Hall, Birmingham, in September, 1926. The office of President formerly held by Sir George Lodge is at present vacant. It could be pointed out that the Coal Smoke Statement Society, London, is in harmonious relation with the League whose work is entirely in the provinces.

IN our notice of the Trade Unemployment Union Congress in our issue of October 2, we pointed out that the continued necessity of paying extended benefit under the Unemployment Insurance Acts might eventually lead to the principle of insurance becoming lost sight of, and we suggested that it might be well to keep the scheme of Unemployment Insurance intact on its contributory basis and administer extended benefit, not contributed to, from a separate fund. We notice that in the recent debate upon Unemployment

Captain Macmillan pressed the same point upon the House. He said that especially in necessitous areas the principle of insurance was beginning to be overlooked by men and women, and urged the necessity of administering standard benefit and extended benefit by separate schemes so as to retain the principle of insurance, the extended benefit being administered from a separate fund contributed to by assistance given by the State as a whole. We feel this point is of the greatest importance. The principle of insurance on an actuarial basis forms the basis of the many schemes for improving the condition of the people and it is steadily being undermined, for human nature cannot distinguish between two classes receiving benefit from the same fund to which some contribute whilst others do not. There is even a tendency on the part of a small class of employees to force the contributions to Health Insurance entirely upon the employer, and those employers who give in to this are acting extremely wrongly.

IN a recent communication to the papers in reference **County Hall Pictures.** to this subject, we are informed that the committee "have been offered pictures not regarded as suitable," and it is added: "Pictures which have no relation to public or municipal life are not regarded as suitable, unless of outstanding importance." While in general agreement with these provisions, the question of what is important is open to much variety of interpretation. It might be that the pictures which dwell most insistently on the importance of commemorating the activities of the L.C.C. to-day would not appear to a later generation of the same interest. The objects of art do not lie wholly in commemorating municipal activity. There is room for the larger interpretations of art as well as those directly concerned with local life. A picture can be an end in itself, without being put to any useful end, and perhaps be all the finer for it. To insist on subject matter revolving round the activities of "public or municipal life," is to leave out from representation those larger interpretations which embrace the whole field of life.

THE consideration of the **County Hall Decoration.** mural decorations—another matter—requires that the approach to any scheme should be on sound and practical lines, and is really less concerned with conformities in regard to subject matter. Given these, we should have very little doubt but that the subject matter to be interpreted would be important and applicable to the situation. And to secure this result, a co-ordinated scheme for the treatment of the walls as a whole should be first prepared, if we are to avoid the mistakes of the past, which cannot be a guide to us, as too often we see that instead

of any solidarity and corporate approach, mural paintings such as those at the Royal Exchange represent a patchwork of more or less unrelated artistry only. If, as in the case of a public building, a competition for a scheme of decorations for the Hall were promoted, we might reach a good result, especially were it the case that a corporate effort was made by groups of artists to prepare their schemes together. It would eliminate that dangerous tendency to be coerced by fashionable names and the assumptions of reputation. We have only to look round an exhibition, such as that now on view at the R.A., to see what scope for fine decoration exists, if only opportunity were forthcoming, and we were less dependent on the recommendations of committees of experts, which result in such memorials as that now the subject of so much controversy. The fine decorative paintings by Ernest Proctor at the International Exhibition would grace any public building, and opportunity should be made for such good art.

The Kitchener Memorial, St. Paul's Cathedral.
MR. W. REID DICK, A.R.A., Sculptor.

GENERAL NEWS

Proposed Cardiff Schools.

A scheme, prepared by the Cardiff Town Council, provides for the erection of new schools and extensions, at an estimated cost of £200,000.

Hull Fire.

Damage estimated at £250,000 was caused by a fire at Bremen warehouse, on the William Wright Dock at Hull, on Tuesday last.

A Lost Rubens Discovered.

Rubens's painting, "Saint Theresa," which disappeared in the seventeenth century, has been found in Berlin.

Proposed Lewisham Town Hall.

Powers are to be sought by the L.C.C. to enable the Lewisham Borough Council to erect a public hall, offices, and shops, on a site in their possession.

Madame Tussaud's.

The directors of Madame Tussaud's & Sons, Ltd., are inviting tenders for the purchase of the freehold site and buildings, the goodwill, and the contents of the Exhibition.

Proposed Yorkshire Sugar Factory.

The United Sugar Co., Ltd., have purchased the site of the airship shed at Barlow, near Selby, upon which to erect a beet sugar factory covering 30 acres.

Newcastle's Proposed Museum.

A site adjoining the Black Gate of the Castle has been given to the Newcastle Society of Antiquaries, upon which to erect a new museum at an estimated cost of £5,000.

Birmingham University.

At a recent meeting of the Council of the University of Birmingham it was announced that Sir Charles Hyde, Bart., had given unconditionally, a contribution of £100,000 to the University.

Yardley Parish Church.

The roof of Yardley's ancient parish church is in danger of collapse owing to the ravages of the death-watch beetle in the roof timbers. The work of restoring the roof will be put in hand immediately.

Concrete Houses.

The Ministry of Health announces that definite arrangements have been made for the erection of 24,060 concrete houses under the subsidy scheme. Of these, 4,606 houses have been completed, and 8,407 are now in course of erection.

Proposed Peterborough Beet Factory.

The contract for the erection of a sugar-beet factory at Woodston, near Peterborough, has been given to the Dyer Company, of Cleveland, America. Work will begin next month on the factory, which will cost £350,000.

New Wimbledon Station.

The Southern Railway has begun a reconstruction of Wimbledon railway station, which is expected to occupy about two years and a half, and to cost about £250,000. The scheme provides for a completely new lay-out of the platforms, buildings, and approaches.

Harlington Parish Church Restoration.

The authorities of Harlington (Beds.) Parish Church, an example of fourteenth-century architecture, are appealing for funds with which to restore the tower. Professor Richardson has prepared a scheme for the work required.

Birmingham Hospital Extensions.

Large additions, including three pavilions, 156 beds, a nurses' home, two isolation wards, and twenty-four beds, are to be made to the Little Bromwich Isolation Hospital, at a total cost of £108,460. Messrs. Dallas & Lloyd, 45, Newhall-street, Birmingham, are the architects.

Proposed Clerical Institution, Liverpool.

A site of several acres at Chidwall, Liverpool, has been secured for the rebuilding of the Training College for Clergy, which was destroyed by fire at Warrington some years ago. An institution to accommodate about 200 residents, costing £100,000 to build and equip, has been designed by Mr. A. H. Moberly, F.R.I.B.A.

Manchester Town Planning.

A scheme for the future development of a large area in the North of England, including parts of Cheshire, Derbyshire, Lancashire, and the West Riding of Yorkshire, has been approved, at a meeting of the Manchester and District Joint Town Planning Advisory Committee in Manchester.

Philadelphia International Exhibition.

Our contemporary, *The Evening News*, stated in a recent issue that Sir Lawrence Weaver, who, as Director of United Kingdom Exhibits, organised the displays in the Palace of Industry and Palace of Engineering, has just left for Philadelphia to report on the arrangement of certain classes of exhibits in connection with an international exhibition which is to be held there next year.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Architectural Competitions.

SIR,—My attention has been called to a letter in your last issue in which it is said that the Institute issued a statement "that no action could be taken because it would cut at the basis of the competition system." Your correspondents go on to say that "this information emanated from the Institute." Your correspondents are mistaken. No such statement has ever emanated from the Royal Institute.

IAN MACALISTER,

Secretary, R.I.B.A.

A New Architectural Society.

SIR,—A few weeks ago the professional Press made the disconcerting announcement that practically concurrently with the completion of arrangements to amalgamate the two principal architectural bodies, and thus present a united front in the endeavour to improve the status of the profession, a new society was about to be formed. Personally I have not received any of the literature broadcast by this new organisation. But the Royal Institute of British Architects has issued to members a statement in regard to the proposed society. It was gratifying to find that all the architectural journals seemed to be enthusiastic in regard to the amalgamation proposals, and they congratulated the two Societies on their consummation. I suggest that these important papers can assist to some purpose now. Let them decide to give no publicity to the affairs or transactions of this new society, and it will soon cease to exist.

EDGAR H. WOODCOCK, A.R.I.B.A.

[* * We confess we are not in sympathy with our correspondent's suggestion. There is an implied obligation on the part of a newspaper to represent impartially and to the best of its ability the public it serves, and therefore to give publicity to any genuine expressions of opinion on matters of public interest. At the same time we regret that the assurances of the R.I.B.A. with reference to registration have not been accepted.—ED.]

COMPETITION NEWS

Secondary School, Worcester.

Worcester City Council have decided to offer 100 guineas and 50 guineas for the first and second designs in connection with a new Secondary School for Girls, to be erected in the City. Mr. Herbert T. Buckland, of Birmingham, is the assessor.

Town Hall Extension, Manchester.

Messrs. Robert Atkinson, Ralph Knott, and Thomas R. Milburn have been appointed by the Manchester Town Hall Extension Scheme Committee as assessors in this competition.

Preston War Memorial.

The design of Mr. H. Pegram, R.A., has been accepted by the Preston War Memorial Committee for an emblematical group to occupy the niche in front of the memorial.

East Bromwich Permanent Benefit Building Society: Larger Offices.

The President of the Institute has nominated Mr. W. Alexander Harvey, F.R.I.B.A., assessor in this competition.

Public Memorial, Blackpool.

The Corporation of Blackpool invite designs for a clock tower with drinking fountains, to be erected as a memorial to the late Dr. V. Cocker, J.P. The assessor is Mr. E. Bert Kirby, F.R.I.B.A. Particulars can be obtained from Mr. D. L. Harbottle, Town Clerk, T. Hall, Blackpool, on deposit of £1 ls. Designs to be sent in by February 13, 1926.

Meanwood Park Colony, Leeds.

Leeds Town Council have resolved that the President of the Royal Institute of British Architects be asked to nominate an assessor in connection with the competition for the extension of the Meanwood Park Colony.

Competitions Open.

Particulars published in "The Builder." Send in designs by the following dates:

Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply particulars., 35, Old Queen-street, S.W.1	April 24	Dec.
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool	Aug. 7	1926 Jan.
Houses for Smaller Middle-Classes and Intellectual Workers. Held under auspices of International Federation of Building and Public Works. Prizes: 1st, 500 dollars; 2nd, 300 dollars; 3rd, 200 dollars. Write to Director-General of the International Federation, 17, Avenue Carnot, Paris	Oct. 30	Jan.
Branch Library, Gabalfa, Cardiff. Limited to qualified architects in Cardiff. Premiums £75, £50 and £30. Mr. Sidney K. Greenslade, F.R.I.B.A., assessor. Apply, with deposit of £2 2s., to Librarian, Central Library, Cardiff	Nov. 27	Jan.
Art Gallery and Museum, Birkenhead. Limited to competitors practising within 20 miles of Birkenhead since January 1, 1923. Premiums: £250, £175, £100. Sir Robert Lorimer, A.R.A., assessor. £2 2s. deposit. Apply Curator, Central Public Library, Birkenhead	Oct. 16	Jan.
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London	Aug. 14	Mar.
Royal National Eisteddfod of Wales, Swansea, Competitions: (1) National Parliament House of Wales (Prize, £100); (2) Street Facade to a Large Stores (Prize, £25); (3) Set of Measured Drawings of Architecture (Prize, £25). Apply for programme to publishers, Messrs. Morgan & Higginbotham, Heathfield-street, Swansea (Is. 2d. post paid). Mr. Arthur Keen, F.R.I.B.A., Assessor	Nov. 6	July 1
Incorporated Architects in Scotland: (1) Rowand Anderson Medal and £100; City Art Gallery and Museum; (2) Rutland Prize (£50) for Study of Materials and Construction; (3) Prize (£10 to £15) for 3rd year Students in Scotland; (4) Maintenance Scholarship, £50 per annum for 3 years. Apply Secretary of the Incorporation, 15, Rutland-square, Edinburgh	Nov. 6	
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnt being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.	Jan. 2	

* Competitions when "warned" or vetoed by the R.I.B.A. are starred.

Pieta Group for the Kitchener Memorial Chapel, St. Paul's Cathedral.
MR. W. REID DICK, A.R.A., Sculptor.
[Unveiled on Thursday.]

OLD DOMESTIC ARCHITECTURE OF ST. ALBANS

By H. V. MOLESWORTH ROBERTS

Part II.—THE LATER RENAISSANCE.

To study what is left of the more symmetrical and developed architecture of the "William and Mary," "Queen Anne," and "Georgian" types, i.e., later in the seventeenth century than that we have considered in Part I, and also that erected in the following century—we must retrace our steps to the city itself.

Perhaps the most interesting and (till lately) a fairly intact example is the house in the Market Place, on its west side, at the corner of Spencer-street (Fig. 1; 18 on plan), a dignified red-brick example with middle and side doorways, with typical hoods and architraves, and original sash-windows of small square panes with wide-filleted bars, altogether a most charming building. It is regrettable to record, however, not only that the south side to Spencer-street and half of the main front has been pulled down on the ground story and replaced by a characterless shop-front of plate glass, which has seriously detracted from the character and unity of the façade; but also that the angle has been deeply splayed off for the shop entrance, leaving the right-angle of the upper floor overhanging in mid-air, which looks structurally bad, as shown in the photograph. However inevitable in a busy city this commercialisation of an important front may be, one cannot help feeling that the work might well have been carried out on more sympathetic lines, with a door flush with the east front and in keeping therewith. The slight extra expense of carrying out a "William and Mary" shop-front would

have benefited the shop and the city of St. Albans alike. How long will the central doorway and northern half of the front survive? We plead for its preservation, or, at least, its worthy transformation.

Of the ordinary Georgian of the eighteenth

FIG. 2.—DARROWFIELD HOUSE, ST. MICHAEL'S (EIGHTEENTH CENTURY).

century, there is much work remaining in St. Albans, marked by the characteristic brick of dull reddish-brown hue with flared "headers," and sash windows with oblong divisions and surrounding wood architrave.

A typical example is Darrowfield House, St. Michael's (Fig. 2; 1 on plan), serving as the vicarage of that parish, a symmetrical mansion with central hooded doorway and "pine-apple" gates; the neighbouring Kingsbury Mill, by the stream (Fig. 3; 4 on plan) is interesting, though slightly later; and Kingsbury House (Fig. 5; 5 on plan) is also a charming building, with windows of a tripartite type, i.e., with side wood mullions and narrow lights flanking them, derived from the Venetian type introduced by Adam and Kent, but with straight architrave. Many of the houses lining Fishpool-street, especially its lower or western end, are irregularly terraced, giving one the impression of some Flemish or Dutch town (8 on plan), the effect having recently been increased by re-pointing some of the joints with pink mortar. These are interspersed with the earlier stuccoed work already described. Interesting also are the terraced cottages adjoining this Abbey Church (Fig. 4), with small wood casements, and false timbering on the further part.

A building of doubtful date, which should be noticed here, was the Collegium Insanorum, private asylum, kept in the eighteenth century (12 on plan), and where William Cowper the poet, is reputed to have stayed during periods of his derangement. It stood till recently at the angle of Dagnall-street and College-street, and gave the latter its name. It has already lost most of its character; the east side was of Victorian date, of brick, the only interesting feature being the south side, a rough compound of bricks and rubble masonry, the latter of which is said to have been culled from some mediæval building; some old fireplaces were found recently, but the original date is difficult to determine. The Collegium has now been entirely swept away to make room for a new poetic modern building.

The traditional Georgian type, but with plainer treatment of cemented or plain brick reveals and thinner sash-bars, survived long into the nineteenth century, and was adopted for the tall street house type, with small front areas and parapet roofs, such as the houses in College-street (11 on plan), still in good service, with their stout brick walls and lofty rooms. Those further south, set farth back, are doubtless later versions of a similar tradition, with their iron porticoes.

This survey may fitly be concluded with a glance at an interesting group of houses on the east side of St. Peter's-street at its upper end (Fig. 6, 19 on plan), a little to the south of St. Peter's Church, for these may sooner or later be in danger of demolition. The house and shop at the angle of the Hatfield-road (on right-hand view), modern brickwork of c. 1830, are already swept away; beyond are seen some typical much earlier weather-boarded cottages almost stuccoed in further still, probably of the eighteenth century, in a very picturesque situation facing a lawn and the War Memorial and stretching up to the churchyard gate. The destruction of the angle building was necessitated by the widening of the road to Hatfield and it is hoped that the other cottages will long remain where they are, to give the right

FIG. 1.—OLD HOUSE, MARKET-PLACE (SEVENTEENTH CENTURY).

FIG. 3.—KINGSBURY MILL, ST. MICHAEL'S.

END OF ABBEY CHURCH BEYOND).

ination to the widest thoroughfare in
Albans.

the future, whenever it does become
sary to alter or rebuild any of the historic
ures of this ancient city for purposes of
hygienic housing, road widening or com-
cial development, let us hope that the new
transformed buildings which take their
s will be at least to some extent worthy to
lant their predecessors; this is a responsi-
which all architects and builders should
ly face in this and all other corners of our
try where men, in this restless age, may seek
alness and inspiration among the remains
rlier times.

or the first part of this article, see our
for September 11.]

OXFORD RENOWNED

is recent addition to the considerable
ellany of historical and topographical works
t Oxford and its University necessarily
akes somewhat of a predatory character, as
uthor at the outset candidly admits owning
ve looted not a few of the best books on the
et. He has not hesitated to add a list by
of a bibliographic "note" which manifestly
nces the reference value of Mr. L. Rice-
y's scholarly essay to which he gives the
"Oxford Renowned."* His artistic
utor Mr. H. B. Knapp-Fisher, F.R.I.B.A.,
ontributed much distinction by his first-rate
r-colour sketches in and about the city,
ally made for this work. The colour plates
nicely reproduced, but it is a pity the
ings were not made to conform better with
proportions of the shape of the pages. A
f his views are printed in monochrome, and
prints are amplified by toned repro-
ns of historic paintings and some portraits
ld masters of Oxford worthies selected
the University treasures. A capital
ograph is included of the famous bust of
hristopher Wren (housed in the Ashmolean
um), the work of Edward Pierce (D.1698).
Oxford Renowned" far exceeds the limits of
ady "Guide Book," although the author
o ordered the subject matter that it cannot
to accommodate the convenience of any
r, ensuring students considerable pleasure
eir itinerary through the colleges, churches
ibraries or further explorations beyond the
nes of the town. The map of Oxford and
nvironments fixed inside the cover of this
is most useful in following the topo-
nical descriptions.

ie introduction opens with particulars about
pproaches to Oxford by road, river or rail,
he chapter on "London Roads" is replete
much interesting information.
Neither Time, Temperance nor Proctors are
likely to eradicate Taverns and Inns," for
ghout the history of Oxford they have
always intimately associated with its high-

ways, and for many centuries naturally formed
an intimate feature in the social life of the
University inasmuch as Common Rooms are
comparatively a modern institution. The
taverns, frequented even by Dons, were dingy
and horrid ale-houses, innumerable and scattered
about Oxford. They passed away gradually,
leaving no recorded history, but many haunted
memories. A few of the better type still remain
and are well known and valued in the enjoyment
of their story of coaching days. Besides "The

[FIG. 5.—KINGSBURY HOUSE, ST. MICHAEL'S.

Mitre" there was "The Angel" (now gone),
"The Golden Cross," "The White Horse," and
"The King's Arms." One of the most charming
water-colour prints by Mr. Knapp-Fisher in this
book shows "The Jolly Farmers," in Paradise-
street, and another view illustrates the courtyard
of "The Golden Cross Hotel." Coffee houses
in time became the vogue and are still fashio-
able.

Mr. Rice-Oxley dedicates "Oxford Re-
nowned" to his fellow-members of Keble
College, and throughout his ecclesiological and
architectural chapters we recognise how
thoroughly an intimate acquaintance with his
subject is manifested with reliability and
judicious care. When Keble College was built
(1868-70) by Wm. Butterfield in red brick
varied by blatant bands and devices of yellow
and black glazed bricks, Ruskin gave up his
daily walk past "his museum" into the parks
as he could not bear the sight of such startling
innovations. "Time is a colleague whom every
good architect consults, and Time has been at
work mellowing and completing his partner's
work..." and it must be admitted that
Butterfield was a creative architect... and
when in years to come artists consider the
buildings erected in the nineteenth century they
will rank this of Butterfield's certainly among
the most original and probably among the best."
Benjamin Woodward's Oxford Museum, based
upon Veronese palaces and detailed under
Ruskin's influence, assuredly will not be included
in the same category. The Broad-street front
of Balliol College designed by Alfred Water-
house (1867-9), known now as the "Broad-
street Hotel," is among the least successful
modern buildings in Oxford. The chapel at
Balliol is "an unlovely structure" designed by
Butterfield in 1856, but it contains some six-
teenth-century glass belonging to the old chapel.
George Edmund Street's Church of St. Philip
and St. James is not mentioned, and no reference
appears as to William Burges being the architect
of the "elaborate and didactic scheme" of stalls
and decoration in the dark, square, lugubrious
chapel of Worcester College, executed some half-
a-century ago. The splendid tower in the
precincts of Christ Church, by Bodley and
Garner, and their excellent additions to Magdalen
College no one will forget; and Sir Thomas
Jackson's repairs of St. Mary's Church, with the
aid of Sir George Frampton, are referred to, as
well as his examination schools and other works.
Henry T. Hare's Town Hall frontage in Blue
Boar-lane "is much better than that in the
main street... so tawdry in its design, so
meretricious in its abundant ornament..."
Lady Margaret Hall, adjoining the Parks, was
built by Mr. Basil Champneys, and the
"Georgian" portion now being added is by Sir
Reginald Blomfield. It is a mistake to attribute
St. George's Hall, Liverpool, to Professor C. R.
Cockerell, the architect of the Taylorian building
at Oxford. He finished St. George's Hall at the
express wish of H. L. Elmes, the genius who
designed it and deserves all the credit.

Lancashire Road Scheme.

The Lancashire County Highways Com-
mittee report in favour of the scheme for the
construction of a road from Liverpool to East
Lancashire at a cost of three millions, and
recommend a grant of £307,000.

SOCIETIES AND INSTITUTIONS

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a general meeting of the Royal Institute, held on Monday, November 30, the following members were elected:—

AS FELLOWS (97).

Prof. L. P. Abercrombie, M.A.
Major W. B. Binnie, M.C.
H. A. Dickman, M.C.
W. G. Dobie.
S. T. Hennell.
F. B. Hobbs.
A. J. McLean.
C. B. Metcalfe.
T. A. Pole.
F. Sutcliffe.
W. W. Tasker, M.C.
H. G. Turner.
A. J. Wood.
J. Wollatt.
E. H. Abbott.
J. H. Bakes.
E. F. S. Biram.
J. W. Boyd.
C. E. Compton.
S. Davies.
S. French.
A. Gardner.
T. Garrett.
J. H. Heywood.
W. R. Morris.
W. R. Nunns.
T. H. N. Parr.
W. H. Raffles.
W. R. Sharp.
G. Simpson.
A. W. Tribe.
J. G. T. West.
A. G. Wilkinson.
C. C. Winmill.
W. H. Adams.
S. P. Anderson.
C. M. Bentley.
D. A. Beveridge.
E. Bird.
C. E. Blackburn.
P. C. Boddy.
C. Brett.
E. J. Brett.
O. A. Bridges.
F. A. Browne.
J. G. Burgess.
E. W. Burnnett.
E. P. Cameron.
E. W. Cannell.

S. E. Castle.
H. G. Cherry.
G. Cotman.
H. S. Davis, M.C.
E. H. Evans.
H. M. Fairweather.
J. Forbes.
B. H. P. Haigh.
L. E. Harper.
L. H. Harrington.
E. J. W. Hider.
J. J. Hill.
W. P. Horsburgh, F.S.I.
E. T. Johns.
A. H. Jones.
F. E. Jones.
H. J. Lyons.
D. G. McIntosh.
H. Macintosh.
J. M'Lachlan.
S. McLauchlan.
D. Matheson.
E. E. Moody.
J. I. Morrison.
J. Murray.
H. B. Newbold.
H. Nurse, M.C.
J. P. Pearce, F.R.Hist.S.
G. Pemberton.
E. J. Pomeroy.
W. H. Poole.

THE LEEDS AND WEST YORKSHIRE ARCHITECTURAL ASSOCIATION.

PRESIDENTIAL ADDRESS.

MR. W. ALBAN JONES delivered his Presidential Address to this Society, in the course of which he said that Leeds stood at the moment fraught with great architectural possibilities. The new street and the University scheme afforded unique opportunities for a new era in the visible character of their city. Certain preliminaries in both cases had been dealt with in so noiseless a fashion that local architects and the public were quite unaware until important commitments had been made. In the case of the new street, over half a mile in length from Victoria-square to Vicar-lane, Sir Reginald Blomfield had been appointed as the designer. For the University buildings, for which an appeal was being made for £500,000, a competition had been apparently decided upon limited to eight selected architects, of whom only one, so far as he had heard, was a Yorkshireman. Evidently in the regard of the powers that be, Yorkshiremen in architecture were not to be compared with Yorkshiremen in cricket.

The civic gateway to the city by means of the L.M. & S. Railway, so reminiscent of a third-rate cattle market, still continued the chief blot on City-square. Archaeological interest was gradually growing round the old gate piers, which were acquiring veneration due to things of past ages. Last May a deputation from the Corporation and the Chamber of Commerce waited upon the railway authorities to urge the necessity of new station premises. This scheme, he noted, was again shelved indefinitely. About the time of this deputation he suggested that if a big scheme of rebuilding was not an immediate possibility on account of cost, then the eyesore of the approach from City-square might be got rid of by a temporary expedient in the form of a screen facade just high enough to hide the shed roofs. He further stated that an inexpensive scheme of this sort, if by means of pillars it supported a large room or suite of rooms over, could be made commercially profitable even if the structure had to be demolished in a few years. He suggested this modest problem as a subject for their students' design competition, but it was thought too limited in scope, and the students' designs exhibited that night therefore represented their efforts in the way of an ideal station entrance.

The students' designs did not, however, assist to illustrate his more limited idea for a temporary station entrance. The frontage now occupied by the old gateways and the small one-story building at the corner was 38 yards long. An erection 10 yards deep could be provided without unduly affecting light and air, giving an area of 380 square yards. Land in the centre of Leeds had sold at much more than £120 per square yard, but even £100 per yard gave over £38,000 as the site value for this 380 yards. When they realised that this valuable land could be built over and still leave exactly the same access for passengers and vehicles to the station, he asked whether any business concern other than a railway company could afford to leave it undeveloped and in its present derelict state? The rooms could either be an annexe approached from the first floor of

the Queen's Hotel or entirely separate entrance and stairs, etc., at the opposite corner where stood the small one-story office.

Referring to the defacement of buildings by electric signs, the speaker said that personally he had no quarrel with the temporary vulgarities as jolly vulgarities in certain quarters of a city, and he thought that in any sense they typified the restless spirit of the age, so apparent in a bustling crowd on a night bent at night. It was quite a matter when we found respectable old offices defiling their fine buildings.

Sir Reginald Blomfield, continued, Jones, had been lamenting a growing tendency since the war of the younger architects to indulge in caustic public criticisms of the work of their colleagues; he would stifle it in public school fashion by deeming it "unmanlike." Unfortunately the rules of the game were not so well defined as those of cricket or professionalism. We could not have both ways: if architecture was an art, we had to realise that living art had over the subject of fierce controversy. He suggested to Sir Reginald that, leaving matters quite out of the question, there was an aspect of youthful criticism since the war could be assessed in terms of cricket, and this aspect had been best put by Sir James B. A vote of thanks to the President was proposed by Colonel Kirk and seconded by J. G. Procter.

The Growth of the Gothic Church Window

In the course of a paper on this subject, before the Society of Engineers on Monday, Mr. H. E. Irving Taylor, M.A., traced the history of the Gothic church window developed in England, comparing and contrasting this development with that in France. The lecturer explained how the original "lancet windows—long, narrow apertures surmounted by a pointed arch, and dating from c. A.D. 1150, were, in England, often constructed in groups whose members became more and more intimately associated as time went on; how a group of lancets became collected within a frame, producing one composite window, slightly spaces of bare stone would often exist between such windows between the arch of the window and the heads of the contained lancets. The author described the first attempts made to obviate this objection by the design of geometrically-shaped apertures, such as circles, triangles, and quatrefoils. This gave rise incidentally to a kind of "tracery," known now by the name "tracery." Evidence was then adduced that the fact became recognised by the designers of the day; that, once their attention centred on the branching stone-work, rather than upon the apertures, they disliked its want of uniformity as to thickness, &c.; that they ultimately quenched their new-born discontent by soiling the apertures as to result in tracery of uniform thickness. Such tracery was known as "Bar tracery." The apertures were then referring their character to the tracery, the immediate result being a complete reversal of the principles of design. Early bar tracery was a simple kind, and was known as "geometric tracery," but after A.D. 1315 the conscious introduction into tracery-design of the "ogee," or S-curve, altered its character to such an extent that it took on another name—"Curvilinear tracery," or "Flowing." The Gothic window in France flourished in this form for another hundred years. In England, however, a comparatively sudden change came over tracery, quickly resulting in the virtual disappearance of the curves, the places being taken by straight lines, placed horizontally and vertically disposed. Some of the names of this period were "Rectilinear," "Perpendicular" had been given to English architecture of that period: c. A.D. 1350 to 1500. The speaker suggested some explanation of this striking deflection from such a natural growth as was seen in France. Of these, the chief one was a suddenly-awakening English predilection for Bible history told pictorially through stained glass.

Women's Hospital, Yellore, South India.

The buildings of the United Mission Women's Hospital at Yellore, now under construction, are part of a large scheme controlled by a dozen or so co-operating Missionary societies, British and American, in South India. It has been embarked upon not only to bring medical relief in a district which has been associated with this type of work through three generations, but also to contribute to the higher education of Indian women in the Madras Presidency by the Medical College and hostel, for which plans have also been prepared for erection on a neighbouring site. The institution is really three hospitals in one—a General Hospital of 125 beds, a Maternity Hospital of 75 beds, and a Children's Hospital of 50 beds—and has to some extent been specially subscribed for under its three divisions, which therefore preserve their identity though embodied in one scheme.

The site is a restricted one, and free planning was rather limited by the positions of certain buildings already erected in a rather haphazard manner. It will, however, be seen from the drawings that the various problems arising in Indian hospital design have been met in a straightforward way. The existing dispensary and out-patients' block was taken as the starting point for the lay-out of the whole hospital, with which it is in direct communication for the admission of patients. The orientation of the ward blocks is necessarily east and west for the exclusion of the sun, with wide verandahs to wards and louvered shutters and sunshades to service rooms. Special provision is made in all buildings for easy access to sanitary blocks or special rooms for outcaste menials for the removal of slops and dirty linen, emptying of bed-pans, etc. Private wards for paying patients and their servants are equipped with their own sanitary and kitchen arrangements; they are for the treatment of persons of different caste or religion, though any one ward is not necessarily set aside continuously for people of one caste only. These blocks are arranged for convenience as groups in connection with the various branches of the hospital—medical, surgical or maternity. The question of caste and religion also influences the cooking arrangements: three main kitchens are provided, one for Brahmmins, one for non-Brahmin Hindus, and one for non-Hindus.

The hospital is being equipped with an electric light plant with crude oil engines, and under the same roof as that installation is included an ammonia ice machine for making half-a-ton of ice per day. The drainage system is carried to a septic tank disposal plant of a modified Dortmund type with simple filters. The central clock tower on the administration block commemorates the comple-

tion of twenty-five years' work in India by Dr. Ida Scudder, the Principal of the Medical College; it is backed by a tank room for the storage of a reserve of water in two tanks of 2,000 gallons each; the town supply being only equal to nine gallons per head per day, the water service of the hospital is supplemented by wells in different parts of the grounds. The wards over the dispensary are designed for temporary use only, the ultimate purpose of this block being for the housing of Anglo-Indian (Eurasian) nurses and dispensary compounders.

In the elevations some inspiration has been taken from the indigenous Dravidian architecture of Southern India. As granite is still obtainable at moderate price for columns and cornices, many of the simpler native forms can be reasonably embodied in a building where strong horizontal lines are mainly relied on for effect.

As elsewhere in India, a good deal of the cost is absorbed in the foundations, owing to the alluvial nature of the ground, a satisfactory bed of hard red earth being found at 6 ft. down, only capable of carrying 1 to 1½ tons per foot. The walls are built of local country brick, protected by a particularly hard lime stucco of very smooth surface, having a natural tendency to mellow in outside use and capable of being thoroughly disinfected inside rooms by washing down. Floors of wards and service rooms are in hard Italian quarry tiling on local terrace brick construction, which is also the method employed for the flat roofs.

The cost of the ward blocks of two stories works out at approximately 10½ rupees per sq. ft. of plinth area, or 4.2 annas per cub. ft.; the Administration block cubes out at 5.3 annas, including a good deal of stone-work in the entrance; the one-story private ward blocks cost about 6 rupees per sq. ft. of plinth area. These prices are exclusive of equipment, sanitation, water supply and lighting. The architects are Messrs. Reginald Dann, M.T.P.I., and Laurence Angus, M.A., A.R.I.B.A., of Madras and London.

House for Sir Alfred Mond, near Tiberias, Palestine.

This house was designed according to the individual as well as the specific climatic requirements of Palestine. The window and door openings are placed so as to allow a cooling atmosphere to enter the house. Open terraces and pergolas serve a similar purpose. Fire-places and chimneys are not required, and are not provided. Stairs leading to the open roof terrace are a feature required by the hot climate of Palestine. Views are opened up to the Galiy Mountains on the north side, to the Lake of Tiberias on the south, and to orange groves on the east. It is proposed to use dark basalt stone, which is the local stone of the district, and the roof will be covered with pantiles. The pergolas are of open construction so that creepers may be readily trained to grow upon them. The house will be used as a residence by Sir Alfred Mond when visiting Palestine.

Screen and Pulpit, Lapworth Church, Warwickshire.

This illustration is reproduced from a photograph recently on view in the Architecture Club Exhibition. Mr. Edwin F. Reynolds, F.R.I.B.A., is the architect.

House at Bagthorne End.

The perspective drawing which we illustrate this week shows a recent example of domestic work by Mr. P. D. Hepworth, F.R.I.B.A.

Widening Piccadilly.

Piccadilly widening figures in a report of the L.C.C. Improvements Committee, which recommends that the Council concurs in the proposal of H.M. Commissioners of Crown Lands, that the strip of land between Piccadilly-circus and Air-street shall be transferred to the Council in two blocks, and that a proportionate part of the purchase money of £100,000 shall be paid when the first block is handed over.

ON THE LOIRE

VIGNETTES OF FRENCH LIFE.

IN a second lecture on the Renaissance Architecture of France, given at the Central School of Arts and Crafts on December 2, Sir Banister Fletcher described the chateaux on the Loire, built in that newly-formed style which was the expression of the beauty of life and the unity of France. The handsome Renaissance palace took the place of the frowning "donjons" of the mediæval castles. In the lovely valley of the Loire these palaces arose with a wealth and variety of skyline that made them natural features of the landscape, such as the Chateau de Chenonceaux, rising from its enchanted site, partly on the river and partly on the water-bridge. Sir Banister described also the famous Chateaux of Blois, Chambord, and others, his descriptions being accompanied by lantern slides. These chateaux, said Sir Banister, were the vignettes of the French life of the period and were to the French what the manor-houses were to England, and represent that charming mingling of Gothic and Renaissance in which the French excelled.

The lecture to be given next week will concentrate on the two most famous palaces of Paris—the Louvre and the Tuileries.

MEETINGS

FRIDAY, December 11.

Glasgow Architectural Craftsmen's Society.—Mr. W. Hunter on "Reinforced Concrete." At the Royal Technical College. 7.45 p.m.

London Society.—Mr. G. Pepler on "Regional Planning Applied to London and its Environs." At 18, John-street, Adelphi, W.C. 2. 4.30 p.m.

Toynbee Planning Institute.—Dr. J. G. Gibbon on "The Problem of Planning Built-up Areas." At 92, Victoria-street, S.W. 1. 6.30 p.m.

Institution of Mechanical Engineers.—Mr. J. G. Pearce on "Foundry Practice: Cast-iron and Modern Engineering Practice"; and Mr. J. E. Fletcher on "Some Applications of Research to Modern Foundry Practice." At Storey's-gate, St. James's Park, S.W. 1. 6 p.m.

SATURDAY, December 12.

Royal Institution of British Architects.—Visit to St. Paul's Cathedral.

MONDAY, December 14.

Royal Institute of British Architects.—Mr. H. A. Welch, F.R.I.B.A., on "The Condition of the Building Industry with Special Regard to the Shortage of Skilled Labour and the Increased Cost of Work." At 9, Conduit-street, W. 1. 8 p.m.

College of Estate Management.—Mr. D. Knoop on "Economics of Rent." At 35, Lincoln's Inn Fields, W.C. 2. 5.30 p.m.

TUESDAY, DECEMBER 15.

Institution of Civil Engineers.—Mr. A. Honeysett on "Pressure-boosting Station for the Waterworks of the City of Monte Video." At Great George-street, S.W. 1. 6 p.m.

WEDNESDAY, December 16.

Institution of Civil Engineers.—Sir C. R. S. Kirkpatrick on "The Development of Harbour and Dock Engineering." At Great George-street, S.W. 1. 6 p.m.

THURSDAY, December 17.

Victoria and Albert Museum.—Mr. C. S. Clarke on "Mogul Painting." At South Kensington, S.W. 7. 6 p.m.

Society of Antiquaries.—Messrs. V. E. Nash-Williams and R. E. M. Wheeler on "Recent Excavations at Caerwent." At Burlington House, W. 1. 8.30 p.m.

Stepney Public Lectures.—Mr. P. J. Ashton on "Night in a Great City; or, London While You Sleep." At 236, Cable-street, E. 1. 8 p.m.

Royal Institute of British Architects.—Professor E. G. Coker on "Some Problems in the Construction of Buildings considered experimentally." At the University College, Gower-street, W.C. 1. 5 p.m.

A METHOD OF TESTING CONCRETE BLOCKS

At the meeting of the Institution of Structural Engineers, held on December 3, Mr. H. G. Lloyd, M.Inst.C.E., A.C.G.I., read a paper on this subject from which the following extracts are taken. The paper, said the speaker, was the sequel to a previous one of "The Consistency of Portland Cement, Mortar, and Concrete," read by the author at the Concrete Institute on April 22, 1920. The object of that paper was "to describe a simple means of ascertaining the quantity of water required when mixing mortar or concrete." For Portland cement it was stated that "the required consistency is such that the Portland cement contains the least quantity of water—no more and no less—in order for it to set completely." For convenience "this may be called the 'standard' consistency. The quantity of water which will produce standard consistency varies with different cements. It is usually expressed as a percentage by weight of the Portland cement." For cement mortar it was stated that "if the ingredients are considered separately, it will be seen that, since the quantity of water required by the cement is known, it only remains to find out how much is required by the sand, in order that it may have the surface of each grain covered by a thin film of water. In other words, the sand needs dampening, so that it may not take the water for this purpose from the Portland cement."

For concrete it was stated that "in order to obtain the standard consistency for any proportions of concrete composed of Portland cement, sand and coarse material, the same principle may be adopted as in the case of mortar." The object of the present paper was to describe the application of the principles, described in the previous paper, to the testing of concrete and hence to describe a method of testing concrete blocks.

Consistency of Neat Portland Cement.

It was also stated that "the standard consistency may be ascertained by means of the Boulogne method, or the Vicat apparatus." Then followed a description of the two methods as practised at that time.

After testing thoroughly the two methods as described, the author had discarded the Vicat plunger method, because it required a wetter consistency than that which results in the greatest strength, and had amended the Boulogne ball test, besides introducing two other methods for the determination of consistency, which might be used in conjunction with it.

The details of the method for the determination of the "standard" consistency of the Portland cement were as follows:—Weigh out 0.900 pounds of dry cement and place it in the centre of a clean slab on the mixing table. Weigh out a quantity of water equal to 20 per cent. of the weight of cement. This amounts to 0.180 pounds. Mix the dry cement by trowel for half a minute. Form a ring or crater of cement with the trowel and leave a small quantity of cement in the ring. Note the time and pour the water into the ring. Turn the dry cement from the outside of the ring into the centre without allowing any water to escape. This would take 45 seconds. The area of the damp portion of the slab would be only about 6 in. in diameter. Hold the trowel with one edge of the blade on the slab, the end pointing away from the body and the blade vertical. Then chop the partly moistened cement with the edge of the trowel from left to right. This should be done in 15 strokes. Make a fresh heap and again chop it up. After three heaps had been chopped in this manner, the slope of the trowel should be flattened to 30 degrees with the horizontal and pressure applied to the cement by the trowel when succeeding heaps were being chopped up. Continue mixing for 2½ minutes from the time that the water was added. The advantage of this method of mixing was that the water was squeezed into the cement, the cement was kept together, and there was little loss of water on the slab, as

the area damped should not exceed an ellipse of 11 in. by 9 in.

Cone Test.—A cone-shaped heap should be made next, by pressing and patting with the trowel against the neat cement supported and shaped by the left hand, which should rest on the slab with the thumb uppermost. Immediately the cone has been shaped turn it over quickly, aided by the trowel placed partly under it. The bottom of the cone should just show a film of moisture which should disappear rapidly.

Ball Test.—Mould the neat cement into a ball in the hands. Small pieces might be picked up from the slab as the ball gained shape if it was dabbed on them. When all the cement had been made into a ball, then squeeze it together and turn it round in the hands and throw it from hand to hand. In one minute from the time that the cone was finished, a firm jelly-like ball should be formed which would feel neither lumpy nor soft. Hold the ball with both hands at a height of 18 in. measured from the slab to the underside of the ball. Then drop it. After impact it should retain its shape without cracking and show a indentation where it impinged on the slab. Reshape the ball in the hands and then drop it gently into a Vicat mould placed on a steel plate, $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by $\frac{1}{2}$ in. thick. The top of the ball should then protrude $1\frac{1}{4}$ in. above the top of the mould.

Plate Test.—Take a steel plate $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by $\frac{1}{4}$ in., weighing 0.67 pounds. Grasp it between the thumb and forefinger of each hand at diagonally opposite corners. Hold it horizontally 6 in. above the top of the mould. Beat the ball with the centre of the plate. Repeat the blows at the rate of one per second. The momentum of the blow should be such that, if the mould was placed on a platform weighing machine, the lever arm would just be lifted when the jockey weight recorded 25 pounds. At the tenth blow the surface tension should be such that when the plate was raised, the neat cement, the Vicat mould and the bottom plate would be lifted also.

Ingredients Used in the Concrete.

The cement used in each series of these tests was the surplus from some 50 samples received for testing which had passed the British Standard Specification (1920) for Portland Cement.

WATER.—The tap water was taken from the Metropolitan Water Board's supply.

Thames ballast was selected for the tests because it was readily available, and owing to its general use on works in and around London, it appeared probable that tests made with it would be of most practical value, being comparable with other gravels.

GRADING.—The Thames ballast was washed dried and then graded by hard labour through sieves mounted on circular frames. Sand was graded to the following six sizes:—

Through $\frac{3}{16}$ in. and on the $\frac{1}{2}$ in. sq. mesh sieve.

Through	16	in. and on the	8	in. sq mesh sieve
"	8	"	16	"
"	16	"	32	"
"	32	"	50	"
"	50	"	75	"
"	75	"	Residue	"

Gravel was graded to the following five sizes: $\frac{3}{8}$ in. and on $\frac{3}{8}$ in. sq. mesh sieve; $\frac{5}{8}$ in. and on $\frac{5}{8}$ in. sq. mesh sieve; $\frac{1}{2}$ in. and on $\frac{3}{4}$ in. sq. mesh sieve; $\frac{3}{4}$ in. and on $\frac{1}{2}$ in. sq. mesh sieve; and $\frac{1}{4}$ in. and on $\frac{3}{16}$ in. sq. mesh sieve.

AGGREGATE.—Two parts by weight of the gravel graded as described were mixed with one part by weight of the graded sand.

Method for the Determination of the Percentage of Water Required to Damp the Aggregate.

SAND.—The method described in the previous paper was as follows:—

“Weigh out half a pound of dry sand; immerse in water in a small bowl; stir it well and allow it to stand. Then pour off the superfluous water and empty the sand on to a clean cloth and wring out the cloth with the sand in it. Screw the cloth up by the four corners and whirl it at arm's length until only occasional drops are thrown off. Pour the sand on to a sheet of plate glass; then with a small trowel push the sand to one side of the glass. Mop up the water on the glass, push back the sand with the trowel and repeat the process to and fro, mopping the glass each time while keeping the sand well mixed, until no pools of water remain on the glass and the glass is only just uniformly damp. Weigh out a convenient quantity of the sand, dry it thoroughly and weigh it again; the difference of weight will be that required to damp the known weight of dry sand. The percentage weight can then be calculated.”

The percentage of water required for each of the grades of sand was obtained in this manner. The average used in these tests was 6 per cent of the weight of the dry sand graded as described already.

GRAVEL.—The percentage of water required to damp the gravel was obtained for each grade in the same manner as that described already for the sand. The average used in these tests was 2 per cent. of the weight of the dry gravel graded as described previously.

Before each test was commenced, the quantity of water was calculated in the manner fully described in the previous paper. The formula used was:—

$$w = \frac{C_e + S_s + G_g}{C + S + G}$$

where w equals the percentage of water by weight required by the combined weights of Portland cement, sand and gravel

C = the weight of dry Portland cement ;
S = the weight of dry sand ;
G = the weight of dry gravel or stones ;
c = the percentage of water required by the Portland cement ;
s = the percentage of water by weight required to damp the sand ;
g = the percentage of water by weight required to damp the gravel or stones.

WEIGHT OF MATERIALS.—The total quantities required for each mix were estimated beforehand, so that almost all of the concrete mixed was filled into the moulds.

MOULDS.—The cylindrical mould used was in. internal diam. by 12 in. long.

At the expiration of 28 days the concrete cylinders were crushed in an hydraulic press between steel plates.

The following simple formulæ showed the relationship between the percentage of cement in the concrete and the crushing strength of the blocks. If the quantity of water required or "standard" consistency was increased, it would be found that the formulæ still held good. This was also the case if a heavier aggregate was used.

When the voids were filled and $N > V$.

Let N = the strength of neat cement.

V = the strength at the critical mixture.

n = the maximum percentage of dry cement by weight = 100 per cent.

v = the percentage of dry cement in the critical mixture.

y = the percentage of dry cement in the mixture of unknown strength.

Y = the required strength with y percentage of dry cement.

Then
$$\frac{n - y}{n - v} = \frac{N - Y}{N - V}$$

Or
$$Y = N - \left\{ (N - V) \frac{100 - y}{100 - v} \right\}$$

If $N < V$, then the formula may be re-cast to suit the case.

When the voids are not filled—

Let M = the strength of the mixture with the minimum quantity of cement.

m = the percentage of cement in that mixture.

y' = the percentage of dry cement in the mixture of unknown strength.

Y' = the strength with y' percentage of dry cement.

Then
$$\frac{v - y'}{v - m} = \frac{V - Y'}{V - M}$$

Or
$$Y' = V - \left\{ (V - M) \frac{v - y'}{v - m} \right\}$$

Comparison of Crushing Strength of Cylinders and Cubes

A comparison of the curves on the diagram showed that the critical point occurred at about the 1:1½:2½ mixture, both in the cubes and cylinders, and at this point the difference in the crushing strengths was at its maximum, decreasing steadily as the voids increased or the cement increased.

Comparison of Tensile Strength and Crushing Strength.

If the average tensile stress be multiplied by 10 and plotted on the Diagram, the line joining the two points would be almost parallel to that of the crushing strength of the cylinders. It therefore appeared that, between the limits of neat cement and the critical point, there was a definite relationship between the tensile strength of briquettes, moulded in accordance with the British Standard Specification, and the crushing strength of cylinders, composed of this type of aggregate and moulded in accordance with the method described herein. Other experiments indicated that this relationship held good below the critical point also.

Conclusion.

The success attained was chiefly due to the method of obtaining standard consistency. It was also due to the great care taken in every detail of the tests, particularly the grading, the tamping into the moulds, the use of the top plate to close the mould and to make the top and bottom of the blocks parallel.

THE WEEK IN PARLIAMENT

WESTMINSTER, Wednesday.

Houses Built.

Mr. N. Chamberlain informed Mr. H. Williams that an estimate based on the returns already received showed that some 32,400 houses were built in England and Wales without State assistance during the half-year ended September 30 last.

The Subsidy for Scottish Housing.

Sir John Gilmour, Secretary for Scotland, informed various members that the general principles governing the selection of makes of houses for special subsidy were cost, construction, output, and limitation of building trade craftsmen to 10 per cent. of total labour engaged.

Atholl Steel Houses, Ltd.

Mr. R. Morrison asked the Secretary for Scotland whether he was aware that the Atholl Housing Company had definitely arranged to pay trade union rates of wages to all their workmen; that this company was excluded from the selection of contractors to receive the special subsidy of £40 per house for Scotland as recently announced by the Prime Minister; that this company's business was prejudiced by this decision; and whether they were to be finally precluded from receiving the Government subsidy.

Sir John Gilmour said he was informed that Atholl Steel Houses, Ltd., had arranged to pay trade union rates of wages to their workmen, and he was aware that this company was not included in the firms approved by the Scottish Board of Health for the purposes of the additional housing subsidy. The number of houses covered by the new subsidy scheme was but a small proportion of the number of houses required in Scotland. Moreover, while this firm's houses would not participate in the additional subsidy, they were still eligible for participation in the ordinary subsidies under the Acts of 1923 and 1924, subject to their cost being reasonable.

Unhealthy Areas.

Mr. Grotian asked the Minister of Health whether he was aware that local authorities were being deterred from representing areas as unhealthy owing to the unfairness of paying nothing for buildings which in themselves were unexceptionable, but which happened to be within an unhealthy area; and whether he would consider the repeal of Section 46 of the Housing Act, 1925, and the putting into force of the recommendations of the report of the Unhealthy Areas Committee, 1921.

Mr. N. Chamberlain said he could not accept the suggestion that no compensation was paid for buildings which in themselves were unexceptionable. Payment on the basis of site value was prescribed by the Act for buildings which were included in a scheme on account of their sanitary condition or because the premises were dangerous or prejudicial to health. He was not in a position to make any statement as to future legislation at the present time.

Compensation for Slum Clearances.

Mr. N. Chamberlain informed Mr. Cassels that the question of the basis of compensation in connection with slum clearance was engaging his attention, but he was not at present able to make any announcement as regarded future legislation.

British Bricks.

Mr. N. Chamberlain informed Mr. Ramsden that as details of local authorities' housing schemes were not submitted for his approval, he had no knowledge whether British bricks were always specified. The Government had urged local authorities to arrange that all contracts for or incidental to works carried out by them should, in the absence of special circumstances, be placed in this country.

Output of Bricks.

Mr. N. Chamberlain informed Mr. H. Williams that returns which had been obtained by the Building Materials Committee indicated that the annual output of common building bricks in England and Wales was now about 5,115 millions.

Brickmakers' Hours.

Answering a question as to brickmakers' hours, Sir A. Steel-Maitland said that in Belgium the working hours of brickmakers in rural brickworks might not exceed ten a day in summer (April 15 to October 15), nine a day in winter, and an average of eight a day over each six-monthly period. In brickmaking by machinery, working hours might not exceed 108 a fortnight and ten a day in summer, and 84 a fortnight and seven a day in winter. In France, the working hours of brickmakers appeared to vary from eight to nine a day. In Great Britain the normal working hours fixed by agreement between the employers' and workers' organisations in the principal centres of the industry were 48 a week.

The Fine Arts Commission.

Sir William Davison asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, if he would state for what purpose the Fine Arts Commission was constituted; and whether the Government did not consider it to be a competent tribunal to decide as to the desirability of removing to another site a monument or piece of sculpture erected in a public place as to which a controversy had arisen.

Mr. Locker-Lampson said that the Fine Arts Commission was appointed to advise Departments of State and public bodies on such questions of public amenity or of artistic importance as might be referred to them, and, in so far as the Hudson Memorial was concerned, they might be considered the successors of the Sites Committee who advised the Department in regard thereto. The First Commissioner considered the Commission a thoroughly competent tribunal to advise on such matters.

Unemployed in Glasgow.

Sir A. Steel-Maitland informed Mr. Buchanan that the numbers registered as unemployed on October 26 in the Glasgow area in the various occupations in the building trades were:—

Carpenters.....	155
Bricklayers	58
Masons	77
Slaters	30
Plasterers	17
Painters.....	470
Plumbers	109
Labourers to the above	1,062
Others	1,019

Total

Cost of the Subsidy.

Mr. N. Chamberlain informed Sir G. Collins that the following table showed the number of houses authorised and the estimated capital value of the Government contributions which would be payable in respect of such houses:—

Housing Act of	Number of houses authorised.	Estimated capital value of Government contributions.	
		£	s.
1923 ..	240,604 ..	£18,045,300	
1924 ..	88,954 ..	£14,232,640	

Demonstration Houses.

Mr. N. Chamberlain informed Lt.-Col. Horlick that £28,800 had been allocated for grants in respect of demonstration houses. The subsidy was not payable until the houses had been completed and had been open to inspection by the public for one month. The actual payments made amounted to £2,800. According to the latest information 51 of the houses had been completed, and apart from work on foundations 48 had not been commenced.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS

NEW LAW OF PROPERTY.

MR. A. E. SOCKETT, Barrister-at-Law, the Senior Reader of the College of the new Incorporated Association of Architects and Surveyors, recently delivered a lecture on the new law of property to members of this Association. At the outset Mr. Sockett, in order to make a comparison between the old and new laws relating to property, pointed out the difference between a freehold estate and a leasehold estate. The former, he said, was an estate of uncertain duration because it may continue indefinitely, and the latter was limited for a definite term of years. He did not want them to think that because an interest was granted to a person for a very long term of years, say, to the extent of 3,000 years, that it was the equivalent of a freehold estate in the eyes of the law. In spite of this, he personally would sooner have a long leasehold than the lowest kind of freehold estate known to our old system of land laws as a freehold estate for life. It should be clearly understood that an estate for life was also a "freehold" estate, although of a low type—it lasted only during a person's life, and a person buying such a freehold would be turned out of the estate or house on the death of the person for whose life the property was held. In dealing with a term of years, no matter how long the term was, the estate was only a leasehold one.

Having pointed out that, under the existing old system of land laws, a freehold estate might be one of three kinds—(1) in fee simple, which was popularly known as absolute ownership; (2) in fee tail, or an entailed estate; (3) the estate for life—the lecturer mentioned that he would cut out of consideration in his lecture No. (2), the estate in fee tail. The new law on such estates had been radically altered. After January next, copyholds would be enfranchised, and the only two tenures remaining would be freehold and leasehold; on the former, in so far as the legal estate in the land was concerned, they would only have the estate in fee simple.

Technicalities in deeds and documents, or in the creation of estates in land, were going to be swept away, although it would take some years for the new system to become assimilated. At the beginning the system would even be more difficult to the public and practitioners, because the old and new systems must be known. When there was an estate for life the absolute interest was to be given to the man who was the tenant for life, but he would hold it to a certain extent on trust for the people entitled beyond his own life; in other words, he would have the estate in fee simple vested in him as a trustee. The ordinary form of conveyance would be simplified, and all the technicalities that had governed it for many years past would cease to have any effect, although he thought they would find that conveyances would continue to contain certain expressions at present in use.

Dealing with the question of contracts for sale, Mr. Sockett said that under the old law, going back to the Statute of Frauds of 1677, a contract with regard to the sale of land had to be in writing and must be signed by the party to be chargeable. The New Law of Property Acts provided that a contract with regard to land should still be evidenced by writing, but it went further, and said that where they had a contract by correspondence the Lord Chancellor might make certain rules which should be incorporated into that correspondence, and together should form what one might call a complete contract. Such rules had already been issued, and members were advised to obtain a copy from the Government printers.

The new law also provided for a new system of registration of estate contracts, which were defined as "contracts to create or convey legal estates." They were not compelled to

register their contract for the sale or purchase of an estate, but he recommended them to do so in all cases when acting on behalf of the purchaser. He advised them to register a contract for the sale of land, a contract which was an agreement for a lease, and also any option that they had to purchase property, as the whole world then had notice of their rights with regard to that particular land.

Among other matters touched upon by the speaker was that of the effect of the new law on intestate succession. In the first place, he said, all real and personal estate would be transferred to the "personal representatives," the executors or administrators. In the case of large estates, the surviving husband or wife would get all personal chattels and £1,000 straight away, free of all death duties, after which he or she was given other rights with regard to the balance of the property. Where there was issue, the husband or wife would get a lifetime interest to the extent of one half, and where there was no issue the surviving partner of the marriage would get a life interest in the whole of the balance of the estate.

The speaker was thanked for his address, and a large number of questions were put to and answered by the lecturer.

[We have ascertained that the Incorporated Association of Architects and Surveyors has a membership of nearly 300, and that a number of applications for membership have still to be considered. The Ordinary Members of Council have been appointed by the Provisional Members of Council, but a President has not yet been elected. The Council is as follows:—Captain C. B. J. Athoe, of London (Secretary, Society of Valuers); Mr. F. E. R. Bicknell, of Bradford (Lecturer, Bradford Technical College); Mr. W. B. Blanchard, of Hull; Mr. W. H. T. Brewer, of London; Mr. W. Forbes Campbell, of Dundee, Stirling and London; Mr. W. H. Fletcher, of Cardiff; Mr. W. R. H. Gardner, of Margate (Official Valuer to Margate Corporation under the Housing Act, 1923-25); Mr. R. S. Gledhill, of London (architect to the Housing Department, Bermondsey Borough Council, 1921); Mr. F. C. A. Harrington, surveyor, of London; Mr. D. Harris (partner in the firm of Widnell & Trollope); Captain C. K. Henderson (of the Surveyor's Office, Yale, Bristol); Mr. J. H. Hirst, F.R.I.B.A. (City Architect of Hull for over a quarter of a century); Mr. R. Holbrow, of Birmingham; Mr. C. J. Innes-Baillie, of London (member of the Royal Society of Arts); Mr. V. A. Lawson, L.R.I.B.A.; Mr. F. Mitchell, of Leeds; Mr. V. S. Peel, of Birmingham; Mr. J. B. Robinson, of Belfast (member of the Royal Institute of Architects of Ireland); Mr. J. Saunders (Surveyor to Leighton Buzzard Council); Mr. W. H. Silk, of Belfast (member of Ulster Incorporated Society of Architects); Councillor A. Sockett (retired Town Clerk of Middlesbrough and now President of the National Association of Auctioneers); Mr. F. Thackeray (Borough Architect, Merthyr Tydvil); Mr. R. F. A. Tutt, Barrister-at-Law (Town Clerk, Leighton Buzzard); Mr. F. G. W. Willard, of Tonbridge, Kent; Mr. E. G. Timbrell (Borough Surveyor of Crewe).

We understand that further members of Council still have to be elected.]

URBAN AMENITY

In the course of a lecture on this subject at Birmingham University, Mr. William Haywood, F.R.I.B.A., said the Town Planning Act of 1909 originated in a desire for the social improvement of new urban growth. The Act made no attempt to deal with built-up areas. It referred only to city land not yet developed, and was designed to prevent a continuance of the sordid and unhealthy social conditions to be found in most of our large industrial towns. The promoters of the Act were not ignorant of the merits of town management and central planning as practised in German cities, but their interest, as that of all English reformers of the nineteenth century, was for the betterment of housing conditions—after the manner already demonstrated at Bournville, Port Sunlight, and the Hampstead

Garden Suburb. Those communities had been built with a desire to give homeliness and charm to all aspects of community life, even to the smallest cottage; and although they were pioneer experiments in reform, they achieved their purpose far better than many of the schemes which had followed the Act.

It was not surprising perhaps that much of the good intended by Town Planning legislation has not been realised. It was difficult to combat incompetence in design, and already there was evidence here and there that new slums for future reformers would not be lacking. Beauty in town planning was a less tangible commodity than road construction and sewage disposal, and the loss by its omission was not so easily measured. Cities which neglected appearance did so to their own social and financial loss. In Birmingham the extension of Corporation streets would have been more profitable had its aesthetic possibilities been considered; and the treatment of the new station wall in Snow Hill, aided by the viaduct across Great Charles-street, would lessen the value of property in that part of the city while these conditions remained.

These were errors of the past, however, and there were hopeful signs for the future. The Ministry of Transport had recently made known that an adequate regard for beauty in the design of new road bridges would influence grants in aid. This was a notable contribution towards a greater consideration for aesthetics in town planning, and the best possible evidence of change in official practice which came none too soon. Public opinion also was moving towards a greater appreciation of beauty in public life and in this new interest we should find the impetus we needed towards a more imaginative treatment of town planning problems. We need not wait for new works in which to show our progress; there was preventable ugliness in our cities, chiefly in the design, production and fixing of such street accessories as lamp-post tramway masts, public conveniences, telephon boxes, and so on—details which, taken singly, might be of no great importance, but which, in the aggregate, were a constant reminder of local civic department.

Incorporated Church Building Society.

At the last monthly meeting of the Incorporated Church Building Society, held at Queen Anne's Gate, Westminster, the Hon. S. E. P. Thesiger, K.C.B., in the chair, grants were made towards rebuilding the church at Withycombe Raleigh, St. John-in-the-Wilderness, £50.

Towards enlarging or repairing the churches at: Ashill, St. Mary, £30; Bermondsey, Christ Church, £40; Dean, All Hallows, £60; Denford Holy Trinity, £50; Dorchester, SS. Peter and Paul, £15; Earlestown, St. John-the-Baptist, £150; Etton, St. Stephen, £25; Foleshill, St. Lawrence, £75; Grimsbury, St. Leonard, £40; Folkestone, St. Peter, £30; Higham, St. Mary, £50; Kentish Town, St. Benet and All Saints, £150; Kingsdon, All Saints, £25; Lode, St. James, £10; Morville, St. Gregory, £50; Newton, St. Botolph, £20; Othry, St. Michael, £20; Putney, St. Margaret, £100; Shocklach, St. Edith, £25; Silver on, St. Mary, £30; Walpole St. Peter, £15; Weston, St. Mary, £25; Whitstable, St. Peter, £225; Woolacombe, St. Sabinus, £50.

From the Mission Buildings' Fund grants were made towards: Allenton (Alvaston), £50; Cleadon Park, £75; Middleton, Holy Cross, £75.

The following grants were paid for works completed at: Birkenhead, Holy Trinity, £25; Brecon, St. David, £200; Brixton, St. Matthew, £80; Denshaw, Christ Church, £75; Gosport, Christ Church, £100; Harlton, St. Mary-the-Virgin, £20; Henlow, St. Mary-the-Virgin, £50; Hill Farrance, The Holy Cross, £30; Holloway St. James, £75; Manaton, St. Winifred, £125; Otterford, St. Leonard, £60; Quinton, St. Swithin, £50; Rampside, St. Michael, £50; Southend, St. Erkenwald, £100; Stydd, St. Saviour, £40; Thaxted, St. John-the-Baptist, £100; Walpole, St. Peter, £20; Walsingham Great, St. Peter, £50; West Hackney, Parish Church, £50; Wigmore, Mission Church, £100; Worstead, St. Mary, £25.

MODERN METHODS OF ROAD-MAKING

MR. C. HERBERT BRESSEY, C.B.E. (Chief Engineer, Roads Department, Ministry of Transport), reading a paper on this subject at the Surveyors' Institution on December 7, said that for the surface of our roads we are seeking more and more permanent and impervious materials which would avoid the vexatious process of frequent renewal. Incidentally, an impervious surface would enable the camber cross-fall of the carriageway to be reduced, thereby adding to the safety and convenience of drivers. Cambers of 1 in 24 and even steeper used to be common. In modern practice this had been reduced to 1 in 48. We are trying to provide highways of such width that it should not be necessary to lay mains and pipes under the carriageway. The wide road has the further advantage of allowing space for tree-planting, and of keeping the noise and vibration of traffic at a tolerable distance from the future householder's windows. We aimed at the suppression of abrupt changes of direction and sharp bends, substituting easy curves of long radius. Where, owing to the configuration of the ground, curves of slight radius were unavoidable, the outer edge was super-elevated or banked. Steep gradients, which so frequently occurred on the rigidly straight Roman roads, were avoided by modifying the line to suit the contours of the hill-side. In laying out the new arterial roads in the neighbourhood of London, we had almost invariably been found possible to limit the gradients to 1 in 30. Besides studying the need of traffic, we desired in forming new roads, so to locate them as to promote the development of the area traversed and increase its attractions. The Roads Improvement Act, passed last session, gives recognition to this principle by conferring upon the Ministry and highway authorities the power to incur expenditure upon tree-planting.

In the case of the North Circular Road between Edmonton and Chingford the flat and low-lying valley of the Lea had to be crossed in order to connect the counties of Middlesex and Essex. It was debated for some time whether the new road should be raised above flood level on an earth bank, in accordance with the usual practice; but having regard to the number of watercourses to be crossed, the difficulty of obtaining sufficient soil for the bank, and the length of time that must elapse before the bank would attain ultimate consolidation, it was decided that the purpose would be better served by a reinforced concrete viaduct which would impose no perceptible obstacle upon the flow of flood water down the valley, and would take all the streams, watercourses and other impediments in its stride. It would, moreover, present the great merit of being capable of completion at a single operation. Resting on a firm foundation of concrete piles, the new structure could be given its permanent running surface as soon as the concrete working had set, whereas in the case of a high earth bank piled on a marshy meadow, some years must elapse before the permanent road surface could safely be imposed, owing to the lengthy process of consolidation to which such banks are subject. The viaduct designed by Sir Owen Williams extends for a length of about 600 yards, and measures 60 ft. in width between parapets. There were two 10-ft. footways and a 40-ft. carriageway. Underneath the footways was space for mains, pipes, etc., whereas the carriageway would be entirely free from any services whatever. Not only would the viaduct connect the teeming suburbs of Middlesex and Essex, now severed by the Lea marshes, but it would also supply one of the last of the missing links in the North Circular Road which would soon span London in a curve 26 miles long extending from Woolwich Ferry to Kew Bridge where access was gained to the new Great West Road, 120 ft. wide.

Having referred in detail to questions affecting arterial roads and road widenings, the lecturer gave some practical information regarding to carriage-way construction. On a firm chalk stratum in Kent, he said, it

sufficed in many cases, after preliminary shaping operations, to form a layer of well-compressed clinker to carry the surfacing coat. Equally serviceable as a natural foundation was a well-drained bed of coarse gravel; finer gravels, and even so fine a material as sand, were not to be despised, provided that the latter had no opportunity of escaping laterally under pressure. The bearing capacity of clay, loam and other similar subsoils was so diminished by the presence of water that the utmost care should be taken to ensure adequate drainage before road-making operations began. The want of uniformity and reliability in the chance supplies of material available for hardcore in areas devoid of quarries had led of late to a notable extension in the use of cement concrete as a road foundation. In the south-east of England, where hitherto, for want of other resources, brick hardcore had largely been used, concrete was increasingly likely to take its place. Hardcore was so nondescript and uncertain a material that it obviously forms a somewhat hazardous foundation for a road designed to endure modern traffic stresses.

The life of a waterbound macadam road could be extended by the judicious use of surface dressings such as tar or various bituminous mixtures, which should be applied in warm sunny weather to a thoroughly swept, dry carriage-way, the surface of which should then be "gritt" with chippings, fine shingle or sand. Crude tar should not be used, as it often contained ingredients injurious to fish life. An interesting development of the last year or two was the introduction for use as surface-dressings of various asphaltic or bituminous emulsions which could be applied cold, regardless of the weather.

The adoption of tar as a surface-dressing led, not unnaturally, to its use as a binder, to be mixed with materials prior to their application, so that the road crust for its entire thickness might become a cohesive mass. The introduction of this method had enabled materials such as Kentish Rag, limestone and slag to be utilised, which would not be suitable for use under the waterbound method.

The speaker then quoted a few particulars from a recent specification for (a) one-coat; and (b) two-coat bituminous clinker surfacing, pointing out in passing that special interest attached to this process as it enabled profitable use to be made of an otherwise almost valueless material—clinker.

(a) The one-coat surfacing was to measure 2 in. in thickness after complete consolidation, and to have a cross-fall or camber of 1 in 50. The mineral aggregate was to consist of well-burnt hard clinker, free from coke, ash, or foreign matter. The bitumen had to comply with certain "penetration" and "solubility" tests. The concrete foundation, after thoroughly cleansing, was painted with a coat of hot bitumen. The clinker aggregate was to be mechanically broken to pass a half-inch mesh screen, and should consist of approximately the following proportions of smaller grades:—

	per cent.
Clinker evenly graded, $\frac{1}{2}$ in. to $\frac{3}{4}$ in.	33
Clinker passing 10-in. sieve	
" " 20-in. "	...
" " 30-in. "	... 20
" " 40-in. "	...
" " 50-in. "	...
" " 80-in. "	... 5
" " 100-in. "	... 10
" " 200-in. "	... 15
Soluble bitumen as specified Clause 20	17
Total ...	100

The clinker was to be thoroughly dried and heated to a temperature of 300 to 350 degrees Fahrenheit. It should be mixed in a mechanical mixer with 17 per cent. of soluble bitumen. After thoroughly mixing, the material was to be delivered on to the road at a temperature of 300 to 350 degrees Fahrenheit and spread with hot rakes to the specified thickness. Rolling should immediately follow with a light roller.

(6 to 7 tons), and as the temperature of the material fell the rolling was to be continued with a 10 to 12-ton roller until no impression was made upon the road surface, which was subsequently to be dusted over with cement, or other approved filler so that a close compact surface might be formed.

(b) The two-coat surfacing comprised a sub-crust or binder course measuring $1\frac{1}{2}$ in. after consolidation and a wearing surface measuring $1\frac{1}{2}$ in., total finished thickness 3 inches. For the binder coat the clinker was so graduated as to form a close dense mixture from $\frac{1}{2}$ -in. gauge downwards, and 12 per cent. by weight of bitumen was added. The top coat or wearing surface was composed of finer clinker graduated from $\frac{1}{2}$ in. downwards, with 10 per cent. of Portland cement and 15 per cent. of bitumen added. The process of laying and rolling followed that already described for the single-coat work.

A road-making material (running surface) now attracting much attention from engineers was cement-concrete. Special interest attached to the application of concrete in view of the wide range of materials utilisable as aggregate, as compared with the very uneven geographical distribution of good road-stone supplies. On the other hand, concrete was somewhat handicapped by the lengthy period of setting and "curing," which was requisite before the new surface could be subjected to the strain of traffic. This unavoidable delay was of less moment in the case of entirely new roads than in that of the reconstruction of existing highways, where acute inconvenience was caused to traffic by any lengthy period of closing. It seemed not unlikely that this difficulty might be mitigated in future by the use of quick-setting cements.

It could not be said that standard specifications and practice had yet been evolved in the matter of concrete road construction in this country. There was considerable variety of method. The construction might take the form of one-course work or two course work, the former consisting of one grade of concrete for the full thickness, while the latter provided two layers of concrete mixed in varying proportion. One course work was simpler, and avoided the risk of cleavage between two layers of differing consistency. For two-course work economy could be claimed in some instances, on the ground that a poorer concrete could be used for the lower layer. In America great lengths of new concrete highway were now being constructed across tracts of country hitherto unprovided with modern roads. The concrete measured 8 in. to 9 in. in thickness and 18 ft. to 21 ft. in width, with a scarcely perceptible camber.

In the actual process of laying the concrete, there was also much variety of practice, some engineers preferring to proceed continuously, while others adopted the "alternate bay" system, in which the carriage-way was divided into slabs of uniform length, each extending the full width of the carriage-way. The length of the slab might vary under different specifications between 20 ft. and 50 ft. If one numbered the slabs consecutively the odd numbers would be laid first, separated by gaps representing the even numbers; these gaps would not be filled until the odd numbers had completely set. By this means it was hoped to counteract the effects of expansion and contraction, which were the bugbear of the concrete road engineer. The transverse joints separating the slab were sometimes disposed at right angles across the road; in other instances they lay at an angle of 60 degrees or so to the kerb-line, so that the impact of the wheels of the vehicle did not strike any slab simultaneously.

The aggregate, consisting of crushed stone or gravel, should not only be clean but should be well graded in size, so as to reduce the percentage of voids to a minimum. In American practice the specification often prescribed that the stone should be retained on a screen $\frac{1}{2}$ in. mesh, and pass a screen of $1\frac{1}{2}$ in. mesh. In some a $\frac{3}{4}$ in. mesh was substituted for a $\frac{1}{2}$ in. Risks of failure in the concrete were greatly reduced by washing the aggregate. The sand, too, must pass a rigorous test for cleanliness, and should be condemned if containing more

than 3 per cent. of loam, earth, or clay. The particles of sand should have the largest possible range of size from fine to coarse, but if only one grade was obtainable, coarse was to be preferred. The water used in mixing the concrete should be reasonably free from alkalis, acids, and vegetable matter. The proportions commonly adopted varied from 1 cement, 1½ sand, and 3 gravel to 1 cement, 2 sand, and 4 gravel. Only a bare sufficiency of water should be added—a very wet mixture encouraged voids. Uniformly reliable results were hardly attainable by hand mixing, unless a very close degree of supervision was exercised. Far greater confidence could be felt if mechanical mixing plant was adopted. The utmost expedition should be used in placing the newly-made concrete in position and consolidating it, for which purpose the use of mechanical tamping and finishing machines was greatly favoured in the United States, where they were found to play an invaluable part in minimising voids. It was often desirable slightly to moisten the sub-grade before depositing the concrete, so as to prevent absorption of water from the concrete.

The precautions to be taken during the setting of the concrete depended largely on the climatic conditions. In moist weather no harm would arise from leaving the green concrete uncovered for a few hours, but in hot sunny weather exposure would lead to the formation of hair cracks. Heavy canvas was often used for protecting the concrete during the first 24 hours of setting. The canvas was then removed, and a layer of earth spread over the surface about 2 in. thick and left there for a fortnight or so.

For the purpose of indurating the surface of the cement concrete, recourse was sometimes had to two or three applications of a weak solution of silicate of soda. Where anxiety was felt as to the soundness of the sub-soil on which concrete was laid, and it was accordingly desired to form a slab qualified to serve as a raft or bridge, one or two layers of metal reinforcement were often introduced into the concrete.

THE COLLEGE OF ESTATE MANAGEMENT

IN the course of a lecture on "Rating in the Metropolis," at the College of Estate Management, Mr. C. Gerald Eve, F.S.I., F.A.I., after explaining the nature of the quinquennial, provisional and supplementary valuation lists, emphasised the fact that a provisional list could be made only where a specific "cause" (such as a structural improvement) had arisen during the current year; a provisional list could not be made in respect of an improvement carried out in a previous year. The "cause" itself must not be one affecting all hereditaments, but must be one affecting a particular hereditament or a particular class of hereditaments. The premises on which a change had been made should not be re-valued for the purpose of a provisional list, for it was the value of the change only which was to be assessed. The supplemental (or quinquennial) list at the end of the year was retrospective, in that, if a property was assessed at a lower value than that in the provisional list, a person who had paid on the higher basis might reclaim the excess. In dealing with notices and objections, he laid stress on the fact that there was under the Act of 1869 only one "meeting" for the consideration by the assessment committee of objections on re-deposit, though this "meeting" might be adjourned from time to time. Objections, which under the Act must be made at least seven days before the "meeting," would be out of time if lodged seven days before an adjourned hearing. Mr. Eve then dealt with the statutable deductions under the 1869 Act and under the Valuation (Metropolis) Amendment Act, 1925, an Act which, in his opinion, was producing some most unequal results for similar properties. In regard to forms and returns, the assessment committee sometimes asked for information which they were not authorised to ask for by Section 57 of the 1869 Act. It was held by the House of Lords that the trade takings of licensed premises need not be divulged.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Penalty Question.

SIR,—We have a contract (with a penalty clause) which should have been finished about six months ago, but owing to alterations, non-delivery of material, and sub-contract work, arranged direct by the architect, being unfinished, we have been unable to complete. Are we entitled to claim the penalty for this delay from our client?

P. W. G.

Measuring Stonework.

SIR,—I have recently been measuring stonework and "taking-out" the labours on the same in detail, and a difference of opinion has arisen as to whether "beds and joints" should be taken to stones similar to the sketches of one given in accompanying sketch, i.e., half-beds to A D and B E, and half-joints to A B and D E,

and whether such measuring would be in accordance with the "Standard Method of Measurements of Builders' Work" issued by the Surveyors' Institution, or otherwise. It will be observed that the faces A B and D E are not in contact with other stones or surfaces, but sunk. Perhaps one of your readers would give an opinion on this.

Q. S.

Fixing Gutter.

SIR,—I have been fixing a new gutter, 5 in. by 6 in. ordinary gauge, in cast-iron, to a building 60 ft. high. The fascia board is 1½ in. by 5 in. Blocked between each rafter is 3 in. by 4½ in. yellow deal, well nailed to sides of rafters, so that the fascia board is practically 4½ in. thick. The fascia and blocks are sound. To the fascia I screwed some specially-made brackets (which fitted exactly all around outside of gutters) of 1½ in. by ¾ in. wrought iron, using 3½ in. No. 18 screws for the purpose. These brackets were fitted every 3 ft. on fascia, so that each 6 ft. length of gutter had three brackets to hold it. Furthermore, I had holes drilled in the gutter

between brackets, and screwed gutter to fascia with 3 in. by No. 18 screws every 1 ft. 6 in. between holes. Now, I am informed that the brackets and fixings would not be safe to carry

a duck board if such should be necessary at any time, and have instructions to make brackets for over wall plate with 3 in. lip and to screw to top of wall plate as well as fascia. I realise this is most certainly stronger, but I would like your opinion as to whether I was justified in stating that the extra strength was not at all necessary. Would any reader work out for me the exact thrust required to draw these 3½ in. screws from such fixing as described, should anyone happen to be working on the roof, which is pitched at 30 degrees to ceiling line with duck board on such staging.

REGULAR READER.

Contract Documents.

[REPLY TO "T. L. W.," DECEMBER 4.]

SIR,—There is no rule as to what document should be furnished the contractor invited to tender for an entire contract. Nor is there any rule of law which determines what document "must" be in his possession, so that he can prepare his estimate. There is nothing, however, to prevent his making an "offer" of tender without taking the precaution to examine essential documents; though it is unwise to do so. And if his "offer" is subsequently accepted it is binding, and he must complete the "entire" contract at the price tendered. It is customary to state in the invitation to tender that documents will be furnished to all. In contracts of any magnitude bills of quantities are provided and these only, together with a form of tender are supplied to the contractor, opportunity being afforded for inspecting the plans, drawings and specification, and, in certain instances, the form of contract. When, however, bills of quantities are not provided, either arrangements are made for the contractor to inspect the specification and drawings, &c., in order to make up his tender, or one, or all, of them, are sent to him, for a period, for a like purpose. It is obvious that it is to the contractor's interest to obtain all documents forming part of the contract, and to which all contractors competing have access, in order that he may have a fair chance. In any case, it is wise to peruse and understand the form of contract proposed to be used for the work, and which the contractor is usually informed in the invitation he will be required to sign.

"CONTRACTOR."

SIR,—In order to prepare a tender for work of any size it will be necessary for the tendering firm to have complete explanatory plans and specification, or complete specification and bill of quantities, with access to the plans on view at surveyor's or architect's office. In the former case it will be necessary for the tendering firm to prepare their own bill of quantities. The documents to be signed on making the contract will be in the first case the contract agreement, the contract plan, and the contract specification. In the second case these will comprise the above documents together with the contract bill of quantities. In many districts it is the custom to embody the specification within the bill of quantities.

"A. X."

Making of Special Bricks.

SIR,—A brickmaking business in a small way, but with up-to-date pressing plant, finds that there is a demand for a certain amount of cant bricks and bull-nose for the making of which the plant does not provide. Have any of your readers any suggestions how this demand may be met without large outlay in the way of new plant?

"BRICKS."

Contracts.

SIR,—I have been told that in this country a tender presented and signed by the contractor, and written acceptance thereof make a good contract in law without any further signed contract agreement. Can you tell me whether this contention is correct?

"QUERY."

THE BUILDING TRADE

RATING AND ASSESSMENT BILL : REPORT STAGE

II.

CONTINUING our notice of the proceedings on "Report" stage of the Rating and Assessment Bill to clause 52, which relates to proceedings on appeal, an amendment was moved accepted by the Government that on appeals to quarter sessions under the Act any appeal to the appeal can be heard either in person or by counsel or by a solicitor. To those of our legal friends who may not have studied the Act, this amendment might give a shock, but quarter sessions there is exclusive right of defence to counsel; but under this Act, this is not the ordinary court of quarter sessions, but duties under the Act are delegated to a committee of the justices of the county, and the justices are to hold their courts at one or more places as the committee may think proper, having regard to the convenience of parties. With regard to clause 48, which deals with the publication of the Bill to London, a very important pronouncement was made by the Minister of Health, in moving that this clause should be omitted from the present Bill. He is reported as having said that after discussion with the London County Council and representatives of Metropolitan boroughs, it had been recognized that as the next quinquennial valuation for London would not take effect until 1931, it would be necessary in any case to introduce a new Bill relating to London before that date was reached, and therefore it seemed better to leave the matters dealt with in this section until the new Bill was introduced. But the most important feature in the Minister's announcement was that he had also given an assurance that the provisions as to separate valuations for rates and taxes should not be barred from consideration when the new legislation was considered. This clearly illustrates the chameleon nature of this Bill in its passage through Parliament. When it was introduced the single valuation prevailing in London was stated to form the model on which the Bill was framed; London was held as the good boy of the class with uniformity which the rest of the country ought to conform to, but now the rest of the country has been allowed to continue in the error of its ways, and more than doubtful whether London should retain its unique position.

As regards the City of London, the Minister stated that some concern had been expressed as to the application of the provisions relating to rating of machinery in clause 24 which had already been passed, and without giving a definite edge he would see when he brought in the new Bill relating to London whether some provision should be made, by giving it retrospective effect, to apply the provisions of that clause to such machinery in the City that came within its scope. Clause 61, which relates to the inspection of documents without payment of a fee, was amended by empowering the local authorities to charge a fee to ratepayers in respect of documents more than ten years old, the Minister undertaking that the clause should be so framed as to prevent an unreasonable charge.

It will be remembered that under clause 64 as amended in Committee, all Crown property used for public purposes was to be rated in accordance with the provisions of clause 22 of the Bill, this clause having been carried against the Government. The Minister moved that this clause should be deleted, and pointed out the difficulties it involved, whilst the present system under which such properties were rated by agreement worked fairly and equitably. The clause was then withdrawn without a division. An amendment moved by Sir Kingsley Wood, for the purpose of facilitating the new rating authority in entering upon their duties on the appointed day by relieving them of certain preliminary work, was also agreed to without a division. In clause 70, which contains the

definitions, on the motion of the Minister, the definition of "rate" was amended so as to make it clear that it should not include water rates, or "garden" or "square" rates, if levied by any persons other than a rating authority.

On Part I of the Second Schedule, the deductions from gross value were the subject of discussion, and an amendment moved by Mr. Peto was accepted by the Government making the amount of the deduction where the gross value of houses and buildings without land other than gardens does not exceed £20, 40 per cent. in place of 33½; but the position did not remain there, for, by a further amendment moved by Mr. Peto, the value of the houses was reduced to £10 instead of £20, the latter figure being deleted. The result of the composite amendments accepted appears to be that where the value does not exceed £10 the deduction is to be 40 per cent., but where it exceeds £10 but not £20 then as in the Bill, 33½.

There is a note to Part I of the Second Schedule, which provides that for the purposes of this part of the Schedule the expression "houses and buildings" does not include mills, manufactories, or premises of a similar character used wholly or mainly for industrial purposes; this has been enlarged on the motion of the Government by the addition to the exceptions of the words, "or hereditaments valued as part of any railway, dock, canal, gas, water, electricity, or other public utility undertaking."

A motion to delete from Part II of the Second Schedule the 75 per cent. of the net annual value of agricultural land was defeated, but an amendment making the 75 per cent. deduction apply to certain buildings used in connection with agricultural operations was left by the Government to a free vote and was carried by a majority of 142—261 votes for, 119 against. The Minister pointed out that this would involve an increased burden on other ratepayers if it was accepted, reducing the rates on agricultural land by some £600,000 to £700,000 out of a total amount of about twenty-one million pounds raised from rural areas, which might involve an increase of between twopence to sixpence in the pound to other ratepayers, but there was some analogy between this proposal and the rating of machinery, and, therefore, the Government felt that the same course should be adopted as in the case of machinery and the decision left to a free vote of the House; but the Minister intimated that no subsidy could be expected from this Government after this concession had been granted. It is not quite clear from the report whether the above figures relate to the 75 per cent. reduction on land alone, or including buildings.

Part III of the Second Schedule, which provides for "Schemes for determining certain deductions in urban areas," was the subject of a Ministerial amendment, which we need not detail here as it is of considerable length.

In the Third Schedule, which specifies the classes of machinery and plant to be deemed to be part of the hereditament, after the words "lifts and elevators" were inserted the words "mainly or usually used for passengers."

In Part II of the Fifth Schedule, clause I, which relates to arbitrators nominated by Courts of quarter sessions, an amendment was accepted, providing that the arbitrator should be a person agreed upon between the parties, or in default of agreement a person appointed by the President of the Surveyors' Institution.

Milford Sanatorium Extension.

The Surrey County Council propose to increase the accommodation of the Milford Sanatorium from 200 to 300 beds, at a cost of £197,746. Mr. Sidney Tatchell, F.R.I.B.A., is the architect.

BUILDERS' FOREMEN AND CLERKS OF WORKS' ASSOCIATION

THE annual dinner of the London Association of Builders' Foremen and Clerks of Works was held at the Holborn Restaurant on Saturday, December 5, the chairman being Mr. F. D. Huntingdon, F.I.O.B. (F. D. Huntingdon, Ltd.). Amongst those present were:—Mr. G. H. White, General Secretary, Mr. F. Denning, Mr. J. T. Cummings, M.B.E., Mr. F. Thorne, F.I.O.B. (President of the London Association of Master Builders), Mr. Austen Hall, F.R.I.B.A., Mr. H. Watkins, Mr. B. Carter.

The toast of "The King" was proposed by the Chairman.

The toast of the London Association of Builders' Foremen and Clerks of Works having been proposed by the Chairman and responded to by Mr. F. Denning, Mr. G. H. White, giving a short history of the Association, said that it was formed in 1894 as The Builders' Foremen's Association by a few enthusiasts, who had as their main object their mutual benefit and protection. In the course of some 20 years the membership had increased and multiplied considerably, and as in course of time many of their foremen members became clerks of works, it became necessary to change their name; soon afterwards they became affiliated to the National Federation in conjunction with other provincial associations, and took their present name. They had now 360 active members. The aims of the Association were many and varied, among them being provision for placing their disengaged members in fresh engagements, provision for an unemployment benefit fund, and a pensions fund for the widows of deceased members. This fund was established in 1904, and at the present time 17 persons were deriving benefit from it at an annual cost of £400. This fund was maintained by a proportion of their subscriptions and any other donations that might accrue.

Mr. Huntingdon, replying, said that foremen and clerks of works were the motors of our industry; without them no architect, however talented, could complete his buildings, and no contractor, however able, could construct them. Speaking of the fund, he said that unfortunately there were cases where one did not have reasonable luck; there were accidents; there were cases when the physique of a man was insufficient, and the case of the man who had given the best years of his life but was passed over, and possibly found himself an old man, still able and competent but unrequited. It was largely for this latter reason that this Association expected substantial support.

Mr. J. T. Cummings proposed the toast of The Building Trade, Architects and Surveyors, This was responded to by Mr. F. Thorne, F.I.O.B., and Mr. Austen Hall, F.R.I.B.A.

Mr. Thorne said that for a long time the industry had been traduced by men of low ideas. Some people were calling them jerry-builders, but for some time past they had been living it down; there was no industry in this country that had the right to call itself a permanent industry unless it be theirs. Foremen and clerks of works, and architects and surveyors, and quantity surveyors were to-day more than ever responsible for the benefit of the goodwill of this country. Since the war they had had to pass through the tribulation of high prices and small output; this phase he believed to be passing away. There was prohibition placed by the crafts upon the crafts in the way of restrictions on employment of labour. Mr. Thorne informed them that he was not a trade unionist, but believed that a man was worthy of his hire, and he (the speaker) believed they should pay a fair price for the best. He wanted them to understand that the master builders wished to create an atmosphere whereby they could elicit the best from the workman; they could only do this by the human touch. He

advocated the policy of letting the workman know that they were personally interested in his welfare, and that the building trade was not, and not meant to be, all pocket and dividend; if this were done he was sure every man would give of his best. If they treated the workman as if he were a human being, they would be stamping out class hatred and its danger. It was possible to-day to bring down the cost of building to such an extent that local authorities would give them the advantage of their finances; but only by private enterprise could the people of this country be housed and covered.

Mr. Austen Hall, F.R.I.B.A., said that it was impossible to exaggerate the value they attached to the skill of the foremen and the clerks of works with whom they came into contact. He had noticed that there existed the closest co-operation between the master builder and the foreman; the foreman was the master builder's trusted agent, whilst superintendent of the works, and nobody was quicker to notice this confidence and understanding than the architect, who found his affairs progressing well as a natural consequence. The improved understanding between the masters and the men depended more upon the foreman than upon anyone else.

The toast of the Visitors was proposed by Mr. G. H. White, and responded to by Mr. Hugh Watkins.

The toast of the Chairman was proposed by Mr. Ben Carter.

Underground Stations Reconstruction.

A start is shortly to be made with the rebuilding of Charing Cross Underground station. A contract has been placed with Messrs. John Mowlem & Co., Ltd., for the construction of the new subways and circulating area beneath the District Railway permanent way and platforms.

The Underground has placed a contract with James Carmichael for the entire reconstruction of the City line stations at Clapham-road and Oval. The schemes provide for the removal of the lifts and the installation of escalators.

Reinforced Concrete.

On the occasion of their tenth anniversary Messrs. Peter Lind & Co. have issued a new catalogue of plans and illustrations of work designed and carried out by them. The firm has closely studied and developed the possibilities of reinforced concrete from an economical, structural and æsthetic point of view, and in selecting these illustrations the endeavour has been to make them representative of the various kinds of structures that the firm has carried out. The brochure must make an intimate appeal to friends and customers, for whom it has been principally prepared, but it has also a broad general interest for all who are in any way concerned with reinforced concrete. The illustrations given are wholly of executed work, for the firm believe that the work itself is greater testimony to merit than any verbal description overflowing with superlatives. The illustrations are divided into sections, the first of which includes industrial buildings, foundations and piling. The big, clean-cut spans obtainable by reinforced concrete are eminently suited for warehouses and industrial buildings generally, where every square foot of space is wanted, and cleanliness and light are qualities of first importance. A good example of work in this connection is afforded by a stove and meter works at Fulham for the Gas Light & Coke Co. Gasworks, coal bunkers and tar tanks are other structures where reinforced concrete has been used with entirely satisfactory results. A large section is given over to bridges and culverts; it is here perhaps that reinforced concrete is seen to best advantage, for the delicate yet firm lines of the bridges depicted are unobtainable in any other materials. The benefit of the firm's experience is placed at the disposal of all who may be contemplating reinforced concrete work. The London offices are at 2, Central Buildings, Westminster, S.W.1.

NEW BUILDINGS IN LONDON.

Battersea.—The L.C.C. have bought a site in Meteor-street, S.W. 8, for a new elementary school. Mr. G. Topham Forrest, F.R.I.B.A., architect to Education Committee.

Becontree.—In view of extensive housing developments, the Co-operative Wholesale Society, Ltd., 99, Leman-street, E.1, have bought a site for a branch stores. Mr. L. G. Ellins, F.R.I.B.A., society's architect.

Bow-road.—Alterations are to be effected at the chapel of the Bow Institution at 2, Bow-road, E. Mr. Albert E. Pridmore, F.R.I.B.A., architect, 3, Broad-street Buildings, E.C. 2.

Canning Town.—Plans have been prepared by H.M. Office of Works, Storey's-gate, S.W.1, for alterations, &c., to the Canning Town Employment Exchange. Messrs. Marrable Bros., contractors, 60, Pretoria-road, E. 11.

Caxton-street.—Messrs. Chandos Court Mansions, Ltd., have let the corner shop in Caxton-street to Messrs. R. Lewis & Co. Mr. Ernest Cannell, M.S.A., 259, High Holborn, W.C.1, architect to property. Messrs. Elliott & Son, shop fitters, Reading.

East Dulwich-grove.—Plans for a new X-ray department, dark room, electrical treatment room, and stores, at the East Dulwich-grove Hospital, have been prepared by Messrs. A. Saxon Snell & Phillips, architects, 9, Bentinck-street, Manchester-square, W. 1. Mr. William C. Moore, quantity surveyor, Devereux Buildings, Devereux-court, Strand, W.C. Messrs. Prestige & Co., Ltd., builders, Cambridge Wharf, Grosvenor-road, S.W.1.

East Ham.—An early start is to be made with the East Ham Memorial Hospital building scheme, in Shrewsbury-road. Accommodation for sixty-six beds is provided in the plans of Messrs. F. E. Meurice & Smith, A.R.I.B.A., architects, 11, New-court, Lincoln's Inn, W.C. Mr. J. Rockwood, F.S.I., quantity surveyor, 25, Bedford-row, W.C.

Edgware.—A row of 17 shops with flats on two stories is to be erected at the corner of Hale-lane and Edgwarebury-lane, under the direction of Mr. F. Howkins, surveyor, 1, Russell-parade, Golders Green. Mr. Howard Farrow, builder, Russell-parade, N.W.11.

Eltham.—Plans have been prepared for new shops, &c., at the corner of Eltham High-street and Grove-yard. Mr. J. A. Emes, architect, 21, Surrey-street, Strand, W.C.

Fetter-lane.—Large offices and works are to be constructed at Rolls-buildings, E.C. 4, for Messrs. *Daily Mirror Newspapers, Ltd.*, 23, Bouverie-street, E.C. 4. Mr. Nelson Wise, excavation, Henshall-street, N. 1; Messrs. Moreland, Hayne & Co., Ltd., steelwork, 80, Goswell-road, E.C.1. Messrs. Killby & Gayford, Ltd., builders, 87, Worship-street, E.C. 2. Messrs. Herbert O. Ellis & Clarke, architects, 3, Old Queen-street, S.W. 1.

Fleet-street.—The entire island site forming New-street Square, E.C. 4, has been bought by Messrs. Wyman & Sons, Ltd., Fetter-lane, E.C. 4, for warehouse and office premises. Messrs. Walter Lawrence & Sons, Ltd., 19, Finsbury-square, E.C. 2, builders. Messrs. B. Goodman, Ltd., 88, Haggerston-road, E., excavation. Messrs. Brown & Barrow, architects, Lennox House, Norfolk-street, W.C. 2.

Fleet-street.—Alterations and improvements are to be made to premises in Wine Office-court, E.C. 4. Mr. John C. Mather, architect, 38, Northampton-street, N. 1.

Hammer-smith.—A further section of the rebuilding scheme at the emporium in Hammer-smith Broadway and King-street, W. 6, is to be put in hand by Messrs. Palmer's Stores, Ltd. Messrs. John S. Quilter & Son, architects, 3, St. James's-street, S.W. 1.

Harrow.—A new factory for Messrs. Kodak, Ltd., Kingsway, W.C., of two stories, 500 ft. in length, is being erected by Mr. H. Peikrill, builder, the Bridge, Wealdstone. Messrs. Trussed Concrete Steel Co., Ltd., reinforced

concrete engineers, 22, Cranley-gardens, Kensington, S.W. 7.

Hemel Hempstead.—A one-story mat ward block for ten beds is to be added to Hemel Hempstead Hospital, for the Comm. Messrs. Paine & Hobday, F.R.I.B.A., archt, 2, Millbank House, Wood-street, Westminster, S.W. 1.

Hornsey.—Accommodation will be provided for 810 scholars at a new school on the Co Housing Estate. Mr. H. Carter Pegg, F.R.I.B.A., 35, Parliament-street, S.W. 1, architect, Hornsey Education Committee.

Hounslow.—Messrs. William Harbrow, builders, 214, Rotherhithe New-road, S.E., are developing an estate for housing purposes.

Lewisham.—The Athelney-street Elementary School is to be enlarged to plans by Mr. Topham Forrest, F.R.I.B.A., architect, C. Hall, S.E. 1.

Morden.—A new terminal station is to be built on the City and South London Railway extension, to plans prepared by Messrs. A. Holden & Pearson, F.R.I.B.A., 9, Knighbridge, S.W.

New Oxford-street.—Messrs. Cole, Loan Co., Ltd., 45, Museum-street, W.C. 2, are extending the premises at the corner of New Oxford-street, and Hart-street, W.C., for Mr. Barclays Bank, Ltd. Messrs. H. Young Co., Ltd., Nine Elms Ironworks, S.W. 8, work. Mr. Dudley S. Marsh, architect, Chancery-lane, W.C.

Norbury.—Plans have been approved for a large palais de danse and cafe-restaurant on London-road. Mr. F. C. Mitchell (Messrs. Mitchell & Mitchell), 80, George-street, Porters-square, W. 1, architects.

Oxford-street.—The plans for the block of residential self-contained flats to be built in Cork-street, W.1, referred to in a recent issue will be designed by Mr. Gervase B. F.R.I.B.A., King's Buildings, King's-square, S.W.1.

Regent-street.—Messrs. Callard Stewart Watt, confectioners and bakers, Old Broad-street, W.1, propose to increase their capital from £250,000 to £500,000, of which £200,000 is required to provide the cost of building and equipping their new restaurant and office premises in Regent-street, W.1. Messrs. How & Co., 3, Broad Court Chambers, Covent Garden, W.C., builders. Messrs. William Woodward & Sons, 15, Great James-street, W.C.1.

St. Pancras.—Funds are being raised to build Queen Charlotte's Hospital, in Marylebone-road, N.W.1. Messrs. Jarvis & Richards, architects, 60, Tufton-street, Westminster, S.W. 1.

Tudor-street.—Messrs. *Daily News and Telegraph, Ltd.*, Bouverie-street, E.C. 4, are to build a large extension of their works and warehouse at the junction of Tudor-street and Bouverie-street, E.C. 4. Messrs. Trollope & Colls, Ltd., builders, 5, Coleman-street, E.C. 2; Messrs. Moreland, Hayne & Co., Ltd., steelwork, 80, Goswell-road, E.C.1. Messrs. M. E. & O. H. Colson, architects, 115, Old Broad-street, E.C. 4. Sir Douglas Fox & Partners, consulting engineers, 54, Broadway, Westminster, S.W. 1.

Upper Edmonton.—The Edmonton Union propose to build a mortuary and post-mortem room at the North Middlesex Hospital, in Silver-street. Mr. J. C. S. Mummery, A.R.I.B.A., architect, 34, Bloomsbury-square, W.C. 1.

Walthamstow.—The Walthamstow, Wanstead and Leyton Hospital, in Orford-road, E. 7, is to be enlarged at a cost of £35,000. Mr. F. J. Coxhead, builder, 45, Blumer-road, E. 1. Mr. J. Andrew Minty, A.R.I.B.A., architect, 35, Craven-street, Strand, W.C. 2. Messrs. Waggett & Bradford, quantity surveyors, 2, Regent-street, W. 1.

Waterloo-place.—New office premises, with a Portland stone frontage, are being erected in Waterloo-place, Regent-street, S.W. 1, to the plans of Mr. Durward Brown, architect, 2, Regent-street, S.W. 1. Messrs. Holland & Hannen and Cubitts, Ltd., builders, 256, Grays Inn-road, W.C.

LONDON MASTER BUILDERS' ASSOCIATION

ANNUAL DINNER.

OVER three hundred members and guests of the London Master Builders' Association were present on Wednesday evening at the annual dinner of the Association, held at the Hotel Victoria, Charing Cross, under the chairmanship of Mr. Fred Thorne, J.P., the President.

Amongst those present were: Sir John Byford, Col. A. J. Foster, C.M.G., Mr. G. Topham Forrest (Architect to the London County Council), Mr. G. W. Humphries (Chief Engineer to the London County Council), Mr. Arthur Keen (Vice-President, Royal Institute of British Architects), Sir Frank Baines (Director of Works, H.M. Office of Works), Mr. J. M. Theobald, F.S.I., Mr. F. Higgs, Major R. J. Holliday (President, Institute of Builders), Mr. Stanley Hamp, F.R.I.B.A., Mr. A. B. Falkner, Mr. W. E. Watson, F.R.I.B.A., Mr. H. D. Searles-Wood, F.R.I.B.A., Sir Walter Lawrence, Sir J. Walker Smith (Director, National Federation of Building Trades Employers), Mr. T. P. Bennett, F.R.I.B.A., Mr. A. H. Adamson, Mr. W. J. Lansdell (President, Southern Counties Federation of Building Trade Employers), Mr. A. A. Fillary (President, District Surveyors' Association), Mr. J. R. Farnood (President, London Builders' Foremen's Association), Mr. A. G. White (Secretary, National Federation of Building Trade Employers), Mr. P. J. Spencer (Secretary, Institute of Builders), Mr. John Croad (President, National Federation of Building Trade Employers), Mr. Josiah Gunton, F.R.I.B.A., Sir Frederick Rice, Sir Charles Ruthen, Mr. C. E. F. Everett (President, Eastern Federation of Building Trade Employers), Mr. G. A. G. Robertson, Mr. Ralph Knott, F.R.I.B.A., Mr. F. L. Griggs, Mr. A. F. A. Trehearne, F.R.I.B.A., Mr. F. D. Huntington, Mr. G. R. Holland, Mr. George M. Burt, Mr. R. L. Roberts, Mr. Henry T. Holloway, Mr. E. J. Brown (Director, L.M.B.A.), Mr. Percy C. Culver, Mr. G. H. Parker, Mr. F. J. Walton, Mr. F. J. Gayer, Mr. A. Alban Scott, Mr. A. Roome, Mr. G. Lansdown, F.R.I.B.A., Mr. H. E. Steinberg, Mr. S. Gordon Jeeves, F.R.I.B.A., Mr. L. Martin, F.R.I.B.A., Mr. E. G. Cole, F.R.I.B.A., Mr. Charles Boot, Mr. Ben Carter, Mr. W. M. Epps, F.R.I.B.A., Mr. R. S. Ayling, F.R.I.B.A., Mr. E. S. Collins, F.R.I.B.A., Mr. G. J. Aldous, Mr. Thos. Wallis, F.R.I.B.A., Mr. G. S. Roberts, Mr. F. Harbrow, Mr. W. B. Simpson, F.R.I.B.A., Professor A. E. Richardson, F.R.I.B.A., Mr. C. Lovett Gill, F.R.I.B.A., Mr. Alfred Cox, F.R.I.B.A., Mr. H. G. Fairhead, Mr. W. J. Walford, F.R.I.B.A., Mr. A. Vigor, Mr. Frank T. Verity, F.R.I.B.A., Mr. Maurice E. Webb, F.R.I.B.A., Sir David Shackleton, Mr. F. Thorne, Mr. H. Austen Hall, F.R.I.B.A., Mr. Roland B. Chessum, Mr. E. Stanley Hall, F.R.I.B.A., Mr. A. J. Davis, F.R.I.B.A., Mr. H. C. D. Whinney, F.R.I.B.A., Mr. G. G. Wornum, F.R.I.B.A., Mr. H. W. Gaze, Mr. A. D. S. Rice, Mr. C. W. Ferrier, F.R.I.B.A., Mr. H. H. D. Anderson, Mr. H. T. Buckland, F.R.I.B.A., Mr. F. A. Minter, Mr. H. J. Barns, Mr. F. M. May, Mr. L. C. D. Hannen, Mr. W. J. Griggs, Mr. E. H. Wall (Assistant Secretary, L.M.B.A.), and Mr. W. J. Rutterham (Secretary, L.M.B.A.).

After the loyal toasts had been proposed by the CHAIRMAN and enthusiastically honoured, Mr. P. C. CULVER proposed "The Architects and Surveyors." In the course of his remarks, he said the younger generation of builders generally had been brought up to regard the architects and surveyors as the "elder brethren" of the industry, and it was in that sense that he welcomed them at the annual festival of the Association. Builders were interested to see that the first step of the newly amalgamated Royal Institute of British Architects and the Society of Architects was to press for statutory registration, and also that representation was being made to the Ministry of Health for the employment of only qualified architects in future on housing schemes. The R.I.B.A. also proposed to give attention, through the medium of the lecture by Mr. Herbert Welch, to the condition of the building industry, and he hoped builders would attend in force. This

illustrated that whilst architects were determined closely to watch their own immediate interests, they had the fullest intention to be mindful of the wants of others. He felt certain there would be important suggestions made at Mr. Welch's lecture, among which he hoped would be found particular reference to the great contribution architects could make to the solution of to-day's problems by restricting their tenders to federated builders. Federated builders had always stood for the betterment of the conditions of their operatives and fair dealing. One of the contributory causes of dissatisfaction was the position of the builder who carried on his calling with an utter disregard of agreements. He paid above or below the rate to suit the needs of the moment, and readily took full advantage of the voluntary services of his fellows who gave their time and talents to the settlement of wages and conditions, drafting of model forms of contract, and assisting in the preparation of such monumental works in their industry as the Standard Mode of Measurement. He hoped that by the architect's personal example and encouragement there would be evinced in the future greater evidence of the determination of the profession to see that every possible support was given to the federated builders throughout the country in their efforts to promote the best interests of all those connected with the industry.

In responding, Mr. ARTHUR KEEN said that 130 years ago Sir William Chambers, the architect of Somerset House, writing on the essential qualifications of an architect, said: "To the excellence of the designer's art must be added the humbler but not less useful skill of the mechanic and the accountant." In the L.M.B.A. the industry had a strong and effective body, and he wished well to it. The association which existed in all the trades and industries of the country, among professional men, among artists, among operatives, appeared to him to be in a very marked way characteristic of the present age and of the country. They had an extraordinary value in promoting progress and development, and the essential test he would apply to them was the test of service: if they existed to render more efficient the services their members rendered to the community, or if they existed merely to secure the material interests and well-being of their members. If the latter was the case, instead of being valuable they were only injurious. They all had the right to secure by combination their proper rights and privileges, but they had to respect the rights of others, and while they lived in communities "the care of each for the well-being of all" was not a bad ideal. It had been stated that the industries of this country were governed by thousands of societies and combinations of people, and that the great majority of them had by degrees assumed the position that they were out for selfish aims; that they were operating not for the expansion of trade, but for its limitation, and that they were responsible for a great deal of the present unemployment. He (the speaker) was afraid it was perfectly true, and it was a very serious accusation. The Royal Institute of British Architects spent a great deal of time and money on architectural education, and found that extraordinary results had been obtained from an architectural school run by architects. Training in schools rather than apprenticeship was a growing tendency, and one could not consider the conditions obtaining in the building industry to-day without feeling that the disappearance of apprenticeship was inevitable, and had to be reckoned with. In his opinion the solution of the apprenticeship problem in the future would be found in the technical schools. They all knew the limitations of the technical schools, but was it impossible that the schools of building should be run by the builders? He thought it was up to the builders to take in hand the technical schools and shape them to their own requirements. It would require a great deal of organisation and imagination to carry it through, and there was no one better qualified to do so than the members of the L.M.B.A.

Mr. J. M. THEOBALD, in a humorous speech, which was much appreciated, responded for the surveyors.

The toast of "The Association" was proposed by Mr. TOPHAM FORREST, who said there can be no question as to the need for the closest co-operation between everyone concerned in the design and construction of buildings, and to

that end he ventured to suggest that it would do a tremendous amount of good were recognition given to the craftsman who had performed an exceptionally fine piece of work. The recognition of individual effort stimulated emulation, and went a long way to obtain harmonious working between employer and employee. Since 1921 there had been a great activity in the building industry throughout the world, and most who had had the privilege of travelling beyond these shores had been impressed not only with the enormous volume of work, but also with the standard of excellence which had been attained in many places. He did not think, in fact he was sure, they need be ashamed of the part which Britain, and London in particular, had played in this great building revival. In spite of controversial questions the results might be considered as really wonderful. Work was being produced to-day which, in its excellence of design, its execution, and its commercial soundness, had never been surpassed. There was an absence of the parrot-like repetition which debased, and in its place a variety of original design which could only be successfully translated into reality by the most effective organisation and the highly skilled workman. Legislation in past years had all been directed to limiting the hours of labour and raising wages, but national forces were stronger than legislation, and the whole industrial machine had to be speeded up and output and production increased, or he was afraid they would very soon become a nation of unemployed. They would, no doubt, expect him to say something about new methods of construction as distinct from traditional brick methods, but it would only be necessary to express the hope that members of the Association would make every endeavour to adapt themselves to the new conditions, so that they might undertake the work and not allow it to pass into the hands of other organisations.

The PRESIDENT, in responding, said the London County Council had agreed to operate with the Building Industry Committee; that was of the greatest importance, as if the Committee functioned properly it would bring the industry into the place it ought to occupy. They were suffering to-day from a shortage of skilled craftsmen. The Association was endeavouring to overcome the difficulty, but there was a great deal of prejudice to overcome before the Committee came into existence. If a builder took work for a local authority for the erection of houses it entailed the employment of one apprentice for every three craftsmen, and one could not take a contract, whether for 20 or 2,000 houses, without that stipulation. In the past the builders themselves had been to blame for the lack of apprentices, as they preferred to recruit their ranks from the provinces, and they would never get men to come to London now while the difference in the rate of wages was so small. It was therefore incumbent on the London builders to see what could be done to increase the number of apprentices, and the building industries committee would help in that direction. Within the past few months the employers and operatives had agreed to waive the employment of one apprentice to every four craftsmen, but that, of course, would not be effective if the one to three proportion became a success. He was hoping that next year the apprenticeship scheme would be put in force, and would be so successful that in a few years all the skilled craftsmen needed would be at the disposal of the industry. In conclusion, he appealed for closer co-operation between all concerned with building, and pointed out that the members of the Association had nothing but good will towards the operatives.

Mr. A. B. FALKNER proposed the toast of "The Guest," and expressed his special pleasure at the presence of Sir David Shackleton, whom he assured of the good will of builders in his forthcoming retirement. One branch of the industry not present that evening was the operative: the grandest designs could not be carried out without the assistance of the operatives, and he assured them of the hearty goodwill of the members of the London Master Builders' Association.

COLONEL A. J. FOSTER, in responding, said the industry was very fortunate in having a long period of housing work before it, and therefore was in a very good position. On the question of associations, he said that so long as they were properly run associations were one of the most important things in the country, and that so long as we had free trade it was up to the industries themselves to look after themselves.

RATES OF WAGES IN THE BUILDING TRADE

(For rates of wages in the Building Trade in Scotland, see page 864.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in the List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender or the names of the willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

DERBY.—The Corporation Housing Committee recommended the erection of a further 270 brick-built houses. They recommend that the Borough Surveyor be empowered to offer additional contracts to W. Walkerdine, Ltd., 25 pairs on Cowsley estate and 25 pairs on the Osmaston estate; E. Morley & Sons (Derby), Ltd., 24 pairs, Osmaston estate; J. H. Fryer, 36 pairs on the Osmaston estate; Special Works Department, 25 pairs, Osmaston estate, at £923 per pair.

DONCASTER.—The Doncaster Industrial Co-operative Supply Co., Ltd., has acquired a site at Duns Croft upon which they propose to erect a branch stores.

DOTGLAS, I.O.M.—The parishioners of St. Mary's propose to erect a new parochial hall for which funds are being raised.

DUBLIN.—The Commissioners have decided to make application to the Minister for Local Government and Public Health for sanction to a loan of £120,000 for an improved water supply.

EAST PRESTON.—The Housing Committee reported that they had approved of a revised lay-out plan for the Darrington site, providing for 26 houses, instead of 12, and, subject to the approval of the M.H.—The R.D.C. also approved the surveyor's specifications for cottages at Angmering, East Preston, Poling, and Warmingcamp.

EPSOM.—The U.D.C. are seeking permission to erect another 30 houses.

FAREHAM.—The R.D.C. are acquiring land at Sarisbury for a housing scheme.

GALWAY.—The Local Government Department is to hold an inquiry into the application of the U.D.C. for a loan of £3,600 for the erection of latrines in Eyre-square and improvements at the Galway Technical Institute.

GATESHEAD.—The T.C. has adopted new works schemes to the extent of £22,593.

GRAVESEND.—A new boiler house is to be erected at the Electricity Works. Mr. Thorald Bennett, 191, Parrock-street, architect.

GRAYS.—A new police court-house is to be built.

HALIFAX.—It is proposed by the B.G. to carry out an extension scheme at the Children's Home in Gibbett-street. C. F. L. Horsfall & Sons, architects, of Lord-street, Halifax, have been instructed to prepare plans.

HARROW.—The Middlesex C.C. has resolved that, subject to the approval of the M.H., a building be erected at Greenhill-crescent, at an estimated cost of £1,500 for the purposes of a tuberculosis sub-dispensary.

HASTINGS.—The Corporation are considering a proposal to assume the whole of the sea bathing arrangements, for which purpose the purchase of 110 new tents at £779 and the construction of ten concrete cabins at a cost of £565 are recommended.—The M.H. has sanctioned a loan of £31,812 for the construction of roads and erection of 60 steel houses on the Broomsgrove estate.—A loan of £2,500 has been sanctioned for sewerage in connection with the development of the Grove estate for housing purposes.

HOLYHEAD.—The Council has been engaged for a considerable time past in endeavouring to carry through a scheme having for its object the development of the town as a seaside resort, the estimated cost is £50,000.

HORNSEY.—The E.C. has decided to construct an open-air school on the Coldfall site, for which plans are to be prepared by Mr. H. Carter Pegg, F.R.I.B.A.

—Another hundred houses are to be erected on the housing estate at Muswell-hill.—Alterations are to be carried out at 22, Broadway, Crouch End, at a cost of £450.

HULL.—The T.C. has accepted the estimate of the City Engineer at £570 5s., for cleaning the Guildhall. Application is to be made to the M.H. for sanction to borrow £3,180 for erection of a porter's lodge at the new infectious diseases hospital.

ILFORD.—The M.H. has agreed to the lay-out of the Horns-road estate for the erection of 98 non-parlour houses and 24 maisonnettes, and tenders are now being invited for the scheme.

* See also our List of Contracts, Competitions, &c.

ILKESTON.—The Borough Engineer has prepared plans for the erection of a pavilion in the Rutland recreation ground at a cost of £400.

INCE.—The E.C. have approved plans of the proposed lay-out of the Rosebridge Council School. Provision is made for 18 class rooms, art room, and other rooms for instruction, and the building is so planned to obtain a north light.

KIRKHAM.—The Parish Church Committee has in hand the proposed extensions to the Church House. Plans are being prepared by Whittaker & Gardner, architects, 26, Birley-street, Blackpool. Plans have been approved for the new institute for the Kirkham and Wesham Working Men's Club. The plans have been prepared by F. Roberts, architect, Fleetwood.

LANCASTER.—A loan of £32,174 has been sanctioned for extending the gas works, a scheme which will cost a total of £54,000.

LEE, S.—The T.C. resolved that application be made to the M.H. for sanction to borrow £201,227 for the erection of 351 "B" type houses on the Hollin Park estate and £47,998 for street works and sewers; £233,311 for the erection of 300 "A2" type and 200 "A3" type houses on the York-road estate and £54,554 for street works and sewers. The Council resolved that the Improvements Committee be asked for a site near the tramway terminus at Cross Gates and also for a site for the erection of a public convenience near the tramway terminus at Meanwood. Sanction has been received from the M.H. for the borrowing of £1,350 and £28,824 for additions to Rodley Sewage Works. The Council has approved plans and estimates of cost of excavations for roads, sewerage, kerbing and surfacing works in connection with the erection of 500 houses proposed to be erected on the York-road housing estate and 351 houses proposed to be erected on the Hollin Park estate, Oakwood-lane. The T.C. are considering a question with respect to the acquisition of a site for sanatorium purposes in lieu of the site in King-lane, Moortown. The Council recommend the construction of paddling pool at Roundhay Park, and widening of Smithy Mills-lane and rebuilding of a bridge. Tenders are to be invited for the construction of additional sewage, stormwater and humus tanks, with sludge pump-house, workshop and store, at Rodley Sewage Works. The Council resolved that, subject to a grant being made by the Unemployment Grants Committee towards the cost of the work, humus settlement tanks be constructed at the main sewage works at Thorpe Stapleton and that the Sewerage Engineer be instructed to prepare and submit the necessary plans and estimates. Plans passed: H. & D. Leslie, two semi-detached houses, Montreal-avenue, Chapel Allerton Hall estate, and eight semi-detached houses, estate off King-lane and Ring-road, Moortown; Pickard & Co., 24 semi-detached houses, Buckingham House estate, Headingley.

LEVENSHULME.—The Conservative Club are raising funds for the enlargement of the club premises.

LIVERPOOL.—Contracts for the erection at a cost of £41,000 of a new elementary school has been sanctioned by the E.C. The school will accommodate 1,200 children.

LONDON (HACKNEY).—The L.C.C. has approved the B.C.'s recommendation for the erection of the urinal, including lighting, draining, making-up of paths, &c., estimated at £440, at Victoria Park. Plans passed: A. J. King, Ltd., factory premises at rear of 116, De Beauvoir-road; Thomas & Edge, factory premises on land at rear of Clapton-terrace Mews leading out of Braydon-road; Crawley & Co., mortuary and laundry at St. Joseph's Hospice, Cambridge Lodge Villas, Mare-street.

LONDON (LEWISHAM).—The B.C. passed plans Eagen Bros., ten houses, Baring-road.

LONDON (POPLAR).—The L.C.C. recommend the borrowing by the B.C. of £36,480 for housing purposes.

LONDON (ROTHERHITHE).—The L.C.C. has decided to reconstruct the flooring at the Silwood-street elementary school, at a cost of about £670.

LONDON (ST. PANCRAS).—The managers of St. Aloysius R.C. school are proposing to rebuild the school, with accommodation for 300 boys.

LONDON (WANDSWORTH).—The L.C.C. recommend the borrowing by the B.C. of £550 for housing purposes.

LONDON (WOOLWICH).—The B.C. recommend that the further twenty houses on Section "C" of the Council's housing estate at Eltham, sanctioned by the M.H., be at once constructed by direct labour under the supervision of the Borough Engineer, at an estimated cost of £12,340. The M.H. are prepared to sanction a loan of £6,800, for the proposed baths at Plumstead. Plans passed: Hoskins Bros., ten houses, Weigall-road.

LUTON.—On a recommendation by the General Purposes Committee the T.C. has decided to make application to the M.H. for payment of subsidy in respect of a further 200 houses, and for sanction to the borrowing of £20,000 for the purpose. Application is to be made to the M.H. for specific approval to the erection of the further 80 houses on the Dunstable-road site.

LYNEMOUTH (NORTHUMBERLAND).—Plans prepared by Mr. J. J. Eltringham, L.R.I.B.A., of Blackhill, have been accepted by the Morpeth R.D.C. for the erection of a new Primitive Methodist Church and Sunday School, to seat 400 and 350 respectively, at a total cost of £9,000.

MALTON.—The T.C. passed plans: Holland-street, sub-station near the Greyhound Inn, for the Electricity Department; London-road, sub-station at the Athletic Ground, for the Electricity Department.

MANCHESTER.—The Corporation has obtained consent for loans totalling £1,386,000 for housing purposes. Land at New Noston has been allocated

for the erection of a municipal school. The M.H. has sanctioned the scheme for the provision of additional lairage accommodation at the city abattoirs. A shelter is to be erected at the Slade tramway terminus.

MIDDLETON.—The T.C. are considering the extension of the present town hall estimated to cost £690, or to erect a new building to cost £1,300. The Engineer, Mr. Harrison, is preparing plans.

NOTTINGHAM.—Proposed schemes for the unemployed at Nottingham will cost £60,000. It is proposed to purchase 38 acres of land in the Sneinton area for housing purposes. The Estates Committee also propose to build houses on the Lenton Abbey estate.

OLTHAM.—The Borough Engineer has prepared plans for a bus garage at Oldham Edge, and tenders are to be invited for the work. Plans are to be prepared for public conveniences at Strineside. The E.C. are negotiating with the B.E. regarding the provision of secondary school accommodation. An orthopaedic clinic is to be established by the E.C. The Corporation are considering with the Chadderton authorities a scheme for the provision of a child welfare centre and clinic.

OSWESTRY.—The R.D.C. has received sanction from the M.H. approving the tender of £8,500 for the erection of 18 houses.

OUGHTRINGTON.—Funds are being raised by the members of the Parish Church for the proposed erection of a church hall.

PETERBOROUGH.—The R.D.C. has decided to place the following in the second part of their housing scheme: Castor (six houses), Northborough (12), Glington (three), Maxey (four), Etton (four), and Fengate (14)—a total of 48 houses. The approval of the Ministry and permission to borrow £2,575 for the erection of six houses at Eye, by Messrs. Gutteridge, has been received.

PLYMOUTH.—The M.H. has sanctioned the borrowing of £1,195 for the conversion of three buildings at Elphinstone barracks. House plans in respect of the 86 houses proposed to be erected by the Great Western (Plymouth) Housing Society, Ltd., at Beechfield, were approved.

PONTFRAC.—The E.C. has decided to proceed with the erection of a new infants' school at Baghill housing estate with accommodation for 250 infants. A site is also to be acquired for the erection of a new Central School to provide accommodation for 560 infants and girls. Plans have also been prepared and approved for extensions to the Love-lane School, at an estimated cost of £1,300.

PORTSMOUTH.—The B.G. has prepared sketch plans for the new children's homes to be erected at Portdown Hill, accommodation being provided for 204 children on the cottage home system. There will be provided on the estate a swimming bath, workshops, recreation room and administrative offices. The E.C. has accepted the gift of Drayton Lodge and grounds for purposes or an institution for crippled children.

PREESALL.—The T.C. are to acquire approximately two acres of land near Ellison-terrace for a proposed housing scheme.

PRESTON.—The T.C. passed plans: A. C. M. Lillie, assembly room, Shepherd-street; A. C. M. Lillie, Royal Infirmary accident block and operating theatre, Stanleyfield-road; D. Ainsworth, 25 houses, Raikes-road, Ansdell-street, Poynter-street, Sellers-street.

REDCAP.—Plans have been prepared by Mr. J. Jackson, architect, of Marske, for the erection of a Working Men's Unionist Club.

REIGATE.—The Corporation are obtaining compulsory powers to acquire three acres at Smoke-lane for a housing scheme.

ROCHFORD.—The R.D.C. has received plans from Christiani & Nielsen, Ltd., for the proposed seven-span

concrete bridge which is to connect Canvey with mainland at South Benfleet. One hundred and two houses are to be erected, the sites being Thunders, Rayleigh, and Great Stambridge (20 each), Rochford (30), and Little Wakering (12).

ROTHERHAM.—The Markets and Baths Committee recommended approval of a plan for the new car market in Corporation-street, showing the pens, stalls and temporary shed, the total approximate cost be £3,500.

SCARBOROUGH.—The Housing, Sanitary and Welfare Committee recommended that houses for the working class should be erected as follows:—Twelve at Seaford, four at Leberston, eight at East Ayton, 12 at Snapham, eight at West Ayton, four at Burniston, and four at Cayton.

SHEFFIELD.—The members of the Endcliffe Baptist Congregational Church, Sheffield, are hoping to build a new church in the near future.

SHOREHAM.—Funds are being raised for the Shoreham Baptist Church Manse. The total cost, with renovations is estimated at £850.

SMETHWICK.—The C.B. approved the draft lay-out in respect of the additional twenty-four houses to be erected by direct labour.

SOUTH KIRBY.—The Parish Council are urging the R.D.C. to acquire further housing sites on the Barnsley road, South Kirby, and to erect an additional 12 houses.

SOUTHWRAM.—The Council has approved the erection of 20 bungalows in Long-lane.

SOUTH SHEFFIELD.—A loan of £1,670 has been sanctioned for the erection of a handicraft centre in Minter-road. The Corporation are to borrow £10,000 for further housing subsidies. The Tyne Dock L.C. Co. have prepared plans for the development of estate adjoining Deans Occupation-road, by the erection of 248 dwellings in flats and 28 shops. Sanction has been given to the borrowing of £14,555 as the Corporation's share of the cost of bridge works and road works in connection with the diversion of Jarrow road.

STALYBRIDGE.—The B.E. has agreed to the scheme of the E.C. for the erection of a school for about 100 children at West Hill. The Borough Surveyor has prepared plans for a mortuary to be erected in King-street.

STANLEY.—The U.D.C. are being urged to undertake further housing schemes, the Durham County Medical Officer estimating that about 1,000 houses are required.

STEYNING EAST.—The R.D.C. are to prepare a scheme for the erection of 14 houses on a site at Patcham.

STRETTON.—The plans have been approved for the erection of a proposed open air schools at Longferry Park, estimated to cost £10,700. The plans have been prepared by P. Howard, A.R.I.B.A., Most street, Manchester. The managers of St. Hilary Schools are proposing to make improvements to the premises by the provision of a central hall, additional lavatory accommodation, cloak and teachers' rooms.

SWANSEA.—A large extension is to be made to the Hotel Metropole, and adjoining property is to be incorporated into the scheme. The plans have been prepared by Thomas & Jones, F.F.R.I.B.A., 15, King-street. The Swansea Highways Committee have approved the widening of Mayals-road, at a cost of £35,504, and Town Hill-road, at a cost of £18,934.

TOTTENHAM.—The D.C. has approved a scheme for the erection of 12 houses in pairs of the non-parade type on the Walshaw site. A scheme is under consideration by the Lancashire C.C. for the proposed erection of a new Council school.

WAKEFIELD.—The management of the Mater Hospital are considering a proposal to spend £50,000 to carry out works of alterations and extensions at the Institution. The plans, prepared by the City Surveyor, Mr. L. Ives, have been submitted to the M.C. for approval.

WARRINGTON.—Plans have been approved by the E.C. for alterations and additions to Hamilton-street schools, at an estimated cost of £1,622. The R.D. are considering the erection of 16 houses type "A" and 20 houses type "B" by direct labour to be planned by J. Eliston, architect.

WEETSLACE.—The U.D.C. is making application to the M.H. for permission to erect 50 houses at Dudley.

WEST HARTLEPOOL.—The Management Committee of the Cameron Hospital has decided to provide orthopaedic department, at a cost of £1,600.

WESTHOUGHTON.—A proposal is under consideration for converting the seniors' department of the County school into a central school, and for the erection of a new building on or near Manchester-road to provide for displaced pupils.

WEST SUSSEX.—The C.C. are taking steps to ascertain the views of local authorities regarding the provision of a colony for mental defectives.

WIGAN.—The B.C. have approved a proposal for the erection of houses on the Bottling Wood estate by direct labour under the supervision of the Borough Engineer, R. B. Donald.

WINCHESTER.—The T.C. are considering a scheme for the erection of a further 42 houses.

WORSBOROUGH.—The U.D.C. are recommended by the Housing Committee that 22 houses be constructed under the Housing Act, 1924. The proposal has been approved. The Electrical Distribution of Yorkshire Ltd., are proposing to build a sub-station at Cuttist End.

WORTHING.—During October plans for the erection of eighteen houses and nine other buildings, representing a total estimated constructional cost of £14,455, have been passed by the Corporation. Plans are being prepared by H.M. Office of Works for the new police office in Chapel-street.

YORK.—The culvert on the Tank Hall estate is to be constructed by direct labour, at a cost of about £5,000. The T.C. passed plans: Culliford & Tind ten houses, Huntington-road; and H. E. Harrow ten, Kilburn-road.

TRADE NEWS

A Gravity Conveyor.

Messrs. Herbert Morris, Ltd., have issued Book 105, dealing with the Morris gravity conveyor, the function of which is to transport goods in boxes or bags, on trays or even without containers, no power being employed except that furnished by the gravitation of the earth. The only running cost is that of lubrication, and this is reduced to a minimum by ball-bearing rollers. The illustrations in the book show how the conveyor is applied to a wide variety of trades and conditions. Figures are given to enable everyone to build up his own system without outside help, and prices are listed in a very simple and straightforward manner. A copy of the book is available to anyone applying to the firm's works at Loughborough.

The Hue Fire.

The inflated price of coal has made it imperative to be economical in consuming it; however careful one is, it is not of much avail if the fire itself burns wastefully and most of the heat escapes up the flue. Messrs. Young & Marten, Ltd., of Stratford, E., state that their "Hue" barless fire burns coal scientifically and with a minimum of waste. A very large range of pleasing suites fitted with this fire are illustrated in their latest brochure, although the fire and deflecting back-bricks can be fitted to an old-fashioned grate. The features of the "Hue" include the following:—A lift-off front, with edge to prevent fuel falling off; an air regulator to stimulate or retard combustion; a removable ash-pan, which collects dust left after combustion; a front arranged to fit between uprights where old bars were fixed; a solid cast-iron well with sloping sides, fluted, so that the fuel automatically adjusts itself during consumption, and a removable bottom grating, thickened and convex in shape, with apertures designed to induce the air current, at the same time cooling the bars and prolonging their life.

Change of Address.

Messrs. Leslie & Roe, paint, colour and varnish manufacturers, of 9, Foster-lane, E.C. 2, have moved from this address to 15, Redcross-street, S.E. 1.

NEW BUILDINGS IN SCOTLAND

Aberdeen.—BARRACKS.—Major W. Neish, Officer Commanding the Depot, Gordon Highlanders, Aberdeen, has announced that a scheme has been practically completed for the erection of new barracks in the near vicinity of Aberdeen. Negotiations have been virtually completed for the purchase of a site of about 54 acres of ground at Burnside, Balgownie, upon which it is proposed to erect, at an estimated cost of about £150,000, up-to-date barracks. The new buildings will provide accommodation for 800 men.

Inverness.—ADDITIONS.—A largely-attended public meeting has been held for the purpose of considering a proposal to reconstruct and make additions to the Northern Infirmary, at an estimated cost of £100,000.

Edinburgh.—HOUSES.—The Town-Planning Committee of the Town Council has instructed the Housing Director to prepare reports on the question of direct labour and the erection of reinforced concrete houses.

Troon.—VARIOUS.—The Troon Dean of Guild Court passed plans: J. Delaney, additions and garage at Hotel Welbeck, estimated cost £1,000; H. Brown, architect, dwelling-house at Golf-crescent, estimated cost £1,400; H. Gale, 55, West Regent-street, Glasgow, house and garage in Bentinck-crescent, estimated cost £4,000; W. Brown, Titchfield-road, house in Bogend-road, estimated cost £1,500; R. Paterson, architect and builder, house in new road off Bogend-road, estimated cost £1,700.

Rothsay.—MUSEUM.—It is stated that the Marquis of Bute intends to erect a museum and library of natural history and archaeology for the Bute Natural History Society. The site selected is in Stuart-street.

Hamilton.—HOUSES.—Plans were submitted to the Dean of Guild Court for the erection of 170 houses at Low Waters.

Dunoon.—BEDROOMS.—Plans were submitted to the Dean of Guild Court for the erection of 24 extra bedrooms, bathroom, &c., at Cordova, West Bay, for Mrs. Cannon.

TRADE CUSTOM: REMOVAL OF OLD MATERIALS

Judge Randolph, K.C., at the Wye County Court, gave judgment recently in a case in which Mr. Edward Mills, builder, Beaconsfield, claimed £5 from Mr. Moseley in respect of work executed, part of a contract, at "Thornton," Burke's Road, Beaconsfield—"balance due as per Messrs. Bailey, Denton & Co.'s certificate for work executed." Defendant, who counterclaimed £5, alleged that plaintiff in carrying out the works at "Thornton," removed the cupboard from the kitchen, a corner chimney board from the hall, and a copper geyser from the bathroom.

Mr. Charles Bray, instructed by Messrs. H. Hart & Co., of Richmond, Surrey, was plaintiff, and Mr. B. L. Reynolds (Wye) for defendant.

Plaintiff claimed that defendant had no right to keep either the cupboards or the geyser. Mr. George Langley Taylor (Mr. Bailey, Denton & Co.), denied that it was custom for a contractor to take away articles in the belief of "removal."

Cross-examined by Mr. Reynolds, Langley Taylor asserted that it was not necessary that articles to be "removed" should be stated in the specification, to remain on premises. He admitted that the cupboards after being pulled down had no backs.

Defendant said that he had had 30 years' experience in the building trade, and it was the custom, when requested, to pull down certain things. Unless otherwise stated, the property of the contractor. The cupboards were only skeletons, while the geyser was not worth more than 4s. or 5s.

Mr. Thomas Thurlow, architect and surveyor, of High Wycombe, with 40 years' experience, gave similar evidence as to custom as also did Mr. John T. Harris, builder, contractor, of Easton Street, High Wycombe. Both declared that unless stipulated, articles became the property of the contractor.

The Judge gave a verdict for £2 10s. on the counter claim. Plaintiff's claim had been admitted.

BUILDING TRADE WAGES IN SCOTLAND

The following are the present rates of wages in the building trade in the principal towns in Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers—Masons, Bricklayers, Plasterers.

* These prices apply to new buildings only. They cover superintendence by foreman and carry a profit of 10 % on the prime cost without establishment charges. A percentage of 1 1/2 should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

A DECISION UNDER THE FACTORY ACT.

A RECENT case under the Factory Act, 1901, in the case *Atkinson v. North-Eastern Railway Company* (*Weekly Notes*, November 21, 1925) should be noted.

The case was heard on appeal from magistrates, and the respondents, the Railway Company, were occupiers of a factory having in the engineers' shop a tube-cutting machine driven by a pulley fixed on a horizontal shaft elevated 13 ft. above the floor level. The shaft had a pulley round which the driving belt passed. On the date in question the driving belt was off the pulley, and a workman employed by the respondents at the request of another of their employees had tried to move the belt from the shaft on to the pulley whilst the engine was running, mounting by a ladder on to a beam 7 ft. from the ground to effect this object. The man sustained injury.

The shaft and pulley were unfenced and the information was laid under section 10 subsection (1) (c) of the Factory Act, which provides, "All dangerous parts of the machinery and every part of the mill gearing, must either be securely fenced, or be in such a position or of such construction as to be equally safe to every person employed or working in the factory as it would be if it were securely fenced." For the respondents it was contended that the shafting was safe from its position, that the man was acting contrary to regulations in attempting to move the belt whilst the engine was running, and that any guard which could have been used for fencing the shaft and pulley must have been removed before the belt could be put on the pulley.

The magistrates had dismissed the information on the ground that from the position of the shaft 13 ft. above the floor level any fencing would have been useless. On the appeal to the High Court the case was remitted to the justices with a direction to convict. The grounds upon which the Judges based their decision were that it was common ground that the shaft and pulley were part of the mill gearing and not fenced, and therefore that an offence would be committed unless it could be shown that that machinery was in such a position or of such construction as to be equally safe to every person employed in or working in the factory as if it had been fenced. The justices had not so found, but had confined their finding to the point that the fencing would have been useless. The Court said it was now being asked to make two assumptions of fact that were not in the case, viz., that this part of the mill gearing was never approached by any person except for the purpose of moving the belt to or from the pulley, and that if there had been fencing no ingenuity could have so constructed it that to carry out that operation it would not have to be removed, but the justices had come to no such findings of fact, but had based their decision on a finding that the fencing would be useless, because the shaft was 13 ft. above the ground.

It is difficult to say why the decision was remitted with a direction to convict instead of being referred back for a proper finding of fact on the present brief report of the case. The finding that a fence would be useless was off the point which the section is aimed at, which is whether unfenced the mill gearing, owing to its position or construction, was equally safe as if fenced to anyone employed or working in the factory, and the case serves a useful purpose in directing the attention of the occupiers of factories to the facts that must be proved.

Obituary.

The death has occurred at his residence in Argyle-road, Dublin, of Mr. George J. Crampton, of Messrs. G. & T. Crampton, Ltd., builders and contractors, Hammernsmith Works, Ballsbridge.

The death has occurred at Kingston, near Kingsbridge, Devon, of Mr. H. Clement Ware, aged fifty-seven, the second son of a former Mayor of Exeter. Mr. Ware was for many years connected with the firm of Ware & Son, architects and surveyors, of Exeter.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L. CXXIX.—No. 4,324

DECEMBER 18, 1925

BUILDING INDUSTRY PROBLEMS

THE paper on the "Condition of the Building Industry," which Mr. Herbert A. Welch read at the meeting of the Royal Institute of British Architects on Monday was a timely and able survey of the present position of the industry and contained some excellent suggestions for consideration. It was fitting that such a paper should be read before the Institute and that so representative a body of architects and builders attended to hear it, though it was unfortunate that time did not permit of a fuller discussion of various matters dealt with by the lecturer. Indeed, the central question of the condition of the industry and the relations between the parties representing it are of such importance that we hope an opportunity will be provided in the near future for another paper and a renewed discussion, for the whole question is explored by architects, builders and operatives the better for the industry. Discussion between all interested parties in the building industry appears to be essential before a really satisfactory condition of affairs can be brought about, and we are convinced that only in this way can a better understanding of different points of view and the difficulties of each be understood. We say this in spite of the ever cheap taunt that matters of great urgency are shelved for discussion in season and out of season, with little or no practical results.

Even the discussion on Monday had at least one satisfactory result in the expression of the willingness of the representative building operatives to sit in council with the architects, though it is not to overlook the reason, "if only to ascertain the truth." Builders tell us that the architects say their clients are prepared to pay the price. Mr. Coppock can be assured that although no doubt he is right that architects, builders and operatives all worked too cheaply for the public in 1914, there is a limit to what the public can afford to pay, and there can be no doubt that much building work has been held up or abandoned altogether on account of what the building public considers excessive cost.

To one who listened to Mr. Welch's paper and the ensuing discussion could very well fail to note the spirit of goodwill, if not of hopefulness, that prevailed and the desire to bring about permanent improvement in the conditions of the industry. The principal representatives of the different interests who were expressed their willingness to co-operate, but they evidently had misgivings as to the possibility of securing a general agreement satisfactory to all parties, not forgetting the building owner and the general community. Architects, at all times, are not lacking in a desire to secure more co-ordination and understanding between the various branches of the industry. They do not lose sight of the difficulties in bringing about improved relations between parties who do not agree on first principles, or who do not realise the change of ideas since the war.

Some indication of what these ideas are was afforded by Mr. Coppock in his frank and good-humoured remarks. If we accept his statement that the operatives "will never go back to the conditions of 1914" as a correct representation of the ideas of building trade operatives, then the suggestion of Mr. Barnes may not be wide of the mark that there is an increasing tendency, not confined to the building industry, to do what is thought to be disagreeable and arduous occupation and take to easier jobs—to devote less energy to work for more time to pleasure. Whether this is a correct explanation of the facts of a shortage of labour in the industry and of a reduction of output—and if it is, how far it applies—we do not know, though the observations of another speaker who should be quoted (Mr. W. H. Nicholls, past-President of the National Association of Building Trade Employers), that the best brains are not coming into the industry, may confirm it; but we do not think that many parents who formerly encouraged their sons to become craftsmen or operatives, now prefer them to follow

a "more respectable" occupation. It would be easy to show the folly of such a desire, but we must not ignore its existence and the inferences to be drawn from it. On the contrary, we should endeavour to understand it, as we no doubt can if our vision and understanding are wide enough.

A good part of Mr. Welch's paper dealt with the "Congress of the Building Industry," which was started in the United States and was inspired, it is interesting to note, by the Industrial Parliament for the Building Industry which was formed in this country at the end of the war, but which, we regret, was terminated after a short existence. It appears that, in the United States, until recent years, "there were various disagreements between the building crafts workers and their employers, the causes of which were unknown to the architects or ignored by them, and indeed it appeared as if neither party to these controversies wished to recognise the interests of anyone else in either the cause or the result of their quarrel. Sometimes when the situation became serious either labour or the employers would call upon the public to support their just (?) contentions; but as a general rule the disagreements were fought out privately, and sometimes the public interest was totally ignored or sacrificed in the terms of the final settlement."

The "Congress of the Building Industry" was started in a preliminary way in 1920, but in the following three years it developed into a group of local organisations in half-a-dozen of the more populous communities: New York, Boston, Philadelphia, Portland (Oregon), Seattle, and the State of New Jersey. Each of these organisations includes within its membership, "the technique of the industry (the architects and the engineers), the labour of all the crafts of the industry, the builders (here called general contractors), the sub-contractors, the building material manufacturers or producers, the building material distributors, and finally, the representatives of finance principally interested in building loans."

The beneficial results of this organisation are given in Mr. Welch's paper, an abstract of which we give elsewhere. "The fundamental principle announced in the declaration of purpose of each of these Congress groups is that the object to be attained is the study of the functioning of the building industry through the joint effort of all the elements that are necessary to the industry, so that the mistakes and the difficulties may be done away with that lie in the way of an adequate service of the industry to the public. . . . The work done jointly on these various committees by architect, engineers, labour men, building trades employers and others interested in building work has established between the individuals thus working together an understanding of and a sympathy with each other's problems, of the functioning of the industry as a whole, and of the relation of any one part to the whole, which unquestionably will result in a willingness to be more reasonable when those difficulties arise."

We welcomed the formation of the Industrial Parliament for the Building Industry referred to, and though we regretted the decision to terminate it, no doubt such a result was inevitable at the time and in the circumstances which prevailed in the industry. But in the light of this American experience, ought we not to try again and establish a similar body, possessed, as Mr. Welch says, with "the will to win." There can be no doubt such a body would do excellent work and would prevent much friction in the industry and reduce misunderstandings and disputes to a minimum. Much, however, would depend on the selection of men to represent the industry, and whether or not they were animated by a reasonable spirit and a desire to serve the community as well as the interests they represented. We are afraid we too often think of the special interests of those who appoint us to office and not enough of the well-being of the general community. If the new spirit in the industry of which we have heard a great deal lately includes this idea of service, then the signs are indeed propitious.

NOTES.

Waterloo Bridge.

WE refuse to believe that the decision of the L.C.C. to construct a new bridge in place of the old Waterloo Bridge will be carried into effect. To their everlasting credit there were some thirty-two members who voted for its retention, but the vote which was hostile to the retention of the bridge was, we venture to affirm, largely founded on ignorance of the real value of the bridge and of the finer issues which the problem has raised. We understand the motives of those who condemn the bridge, but the only solid ground on which they can base their action is a mistaken idea of the public convenience, and public convenience is, of course, a far more important matter than anything like beauty or sentiment!

A.A. Conversazione.

THE annual conversazione of the Architectural Association was held at the premises in Bedford-square last week, the President (Mr. H. S. Goodhart-Rendel), and the Hon. Mrs. Wilbraham Cooper receiving the guests and members. An excellent musical programme was provided by the Keith Prowse Orchestra in the library; this was augmented by dancing in the lecture room. For the non-dancers there was

an interesting exhibition of members' holiday sketches; an exhibition of sketches and photographs of Denmark and Sweden, made on this year's excursion; and a selection of work by students at the School. The large gathering included many well-known architects.

Plea for English Craftsmanship.

At a time when artists and craftsmen are finding it difficult to sell their work, this season of present-giving suggests a way of getting more permanent value for money spent. We are interested to read an account of the purchase of a collection of different craftsmen's work as a christening gift, which suggests a similar direction in the giver. Much money is spent on the ordinary ephemera of the picture shop window, on colour prints, &c., largely of foreign origin, and which spent more wisely in the direction of real craftsmanship would often at the same cost secure something of permanent artistic value endowed with treatment and personality. The public would be well advised to secure this better value for their money, which at the same time is of more advantage to themselves and to the craftsmen whose work they thus promote. We have seen as many pounds spent on some colour print reproduced in countless numbers and of more than doubtful

artistry as would have secured an original piece of work in pottery or painting or other of the applied crafts. It must be remembered that buying is itself an art.

Choice in Public Memorials.

THE further correspondence on this subject, and suggestions made, suggest that one which advocates the placing, in the first instance, of a temporary model on the proposed site, put in hand, has a good deal to be for it, though a considerable addition to the cost. More than this, however, is required and less easy of attainment. It is said that we are not an artistic nation. It would be truer to say we are not as a nation educated to appreciate intimately enough or judge of form, style, imagination and appropriateness, which do not answer to popular apprehensions. Practical in our own day we overvalue reputation and success, surrender to the pressure of fashion and prevailing tendencies. We do not in fact judge intrinsically enough to stand independence to our choice, and so have no anchorage. Nor is it possible to know how there can be much improvement as long as the expert on one side and the public on the other have so much caprice and accident in their choice. It rests on these insecure foundations.

Church of St. Louis, Vincennes : Longitudinal Section. MM. DROZ AND MARRAST, Architects.

[The exterior walls of this church are of stone and brick, the roof being supported by four reinforced concrete arches with a clear span of 73 ft. 6 in. The four arches are built in pairs intersecting at right angles, the distance between each pair being 40 ft. The church, begun during the war, was but recently completed.]

Partition Walls: A New Material.

WE learn from a correspondent that Professor A. T. Laurie, the Principal of the Heriot-Watt College at Edinburgh, who was Chairman of the Buildings Materials Committee in 1918, is paying attention to the problem of devising partition walls that can be completed without the aid of the plasterer. Professor Laurie has been experimenting for some years past in order to find a substitute for the normal partition wall made of brick or breeze slabs that afterwards have to be plastered. He believes that he has succeeded at last in finding a substitute that is rigid, does not conduct heat or sound, and is at least as durable as brick. He has used the asbestos cement sheet and cemented this with asphaltic cement on to a cork core one inch thick. This cork core is made up of fragments of cork dried and compressed. This material has been used for at least twenty years past in building cold-storage factories and has been found to be a non-conductor both of heat and sound. These asbestos cement sheets are supplied in sizes of eight feet by four feet. Thus Professor Laurie has obtained a panel that is portable and of a convenient size, and which is also solid. This, we understand, can be erected between light wooden supports very rapidly. As soon as the bricklayers have finished on the external walls, the joiners can come in and carry out the rest of the work.

Inner Lining of Outer Walls. PROFESSOR LAURIE states, says our correspondent, that in his experiments in providing the inner lining for the outer wall, he has made a variation. In this case, he reverts to the old solid one-inch wall and lines it inside with asbestos cement sheets. A thin layer of compressed cork is cemented to the sheet and forms a lining between it and the brick wall. Upright "T" sections nailed into docks hold the panels to the wall. If the architect desires it, Professor Laurie states that air space can be left by nailing light straps on to the wall, but he does not consider this to be necessary, as cork is an excellent non-conductor. This method of construction has already been patented. We are informed that a commercial company in Scotland is taking it up, and it is attracting north of the Tweed a good deal of attention from architects and builders.

A Walcot Exhibition. THERE has, we suppose, been no exhibition of Mr. Walcot's work quite so interesting in its way that now open at the Beaux Arts Galleries, of some forty water colours and a dozen of etchings and of oils. The drawings are unequal in their appeal, for some are at the highest level of the artist's powers, whilst others seem to convey chiefly an impression of clever technique rather than of pictorial

Church of St. Louis, Vincennes : Interior View. MM. DROZ & MARRAST, Architects.

[A feature of this church is the wall painting, which is in parts done in true fresco direct on a fresh lime coating applied to the concrete surface. Altar screen, choir, pulpit, and other features are decorated partly with ceramic tiles and partly with coloured cements.]

value. Sometimes Mr. Walcot makes buildings look even worse than they are, whilst in some cases the reverse. One cares little enough what he makes of the Tower Bridge if he can give us such an excellent picture of grey liquidity as his Tower Bridge in a fog. He can do what he likes with his architecture without interfering with the pictorial values. His drawing of Westminster Bridge and St. Stephens is quite a pleasing picture, but the impression conveyed of the Houses of Parliament is of a somewhat coarse and stupid mass and far removed from the dainty delicacy which characterises Pugin's work. There are some oils and etchings included in this exhibition, and one at least of the etchings is probably one of the finest of all our modern productions.

Picture Exhibitions. THERE are many picture exhibitions open now, and none surely so exasperating as the International for, with here and

there something worth seeing, there is an abundance of work which one could wish might never be seen in public. We wonder how it is that in an age like the present, with its excessive sentimentality and super-refinement, there can be tolerated so much vulgarity in pictures which is not even clever enough to be entertaining as well as vulgar.

Rural Industries. WE are glad to know that a list of local craftsmen working throughout the country has been compiled, as it is witness to the growth of a movement which should re-act considerably on the character of industry and to the improvement of village life. There are at present over 600 of these craftsmen, working in towns and villages, either in groups, or singly, and every effort should be made to encourage their work. The influence on village life of industries, in which also the county people can participate, should be most beneficial.

GENERAL NEWS

Change of Address.

Mr. J. J. Taylor, F.S.I., has removed to 11, Gayfere-street, Westminster, S.W.1. Telephone number as at present, Victoria 5448.

Artists' Club Prize.

The prize of ten guineas awarded by the Artists' Club for the best work of the year in painting or sculpture, executed by students of the Liverpool City School of Art, has been won by Miss Baldwin Griffiths.

Oxford Town Planning.

An advisory committee of architects has been nominated by the R.I.B.A. to assist the Oxford Council with town-planning proposals. The members nominated are Mr. E. P. Warren, the brother of Sir Herbert Warren, the President of Magdalen; Mr. H. S. Rogers, the President of the Berks, Bucks and Oxon Society of Architects; and Mr. F. M. Elgood, a former Housing Commissioner at the Ministry of Health and a Past-President of the Town-planning Institute.

Dublin Housing and Town Planning.

At a recent Central Housing Council Conference a resolution was passed to set up a £1,000,000 housing fund. Dublin suffers from a shortage of 37,000 houses. Another resolution was passed approving of the principle of town-planning and stating that legislation should be immediately enacted to give necessary powers for this purpose, and that steps should be taken by the authorities, without delay, to prepare a town plan for Dublin and the surrounding districts.

Preservation of Netley Abbey.

Preservation work at Netley Abbey, founded by Henry III in 1239, has gone so far that all the precarious parts of the buildings are now secure. The north, south, and east walls of the chancel have been completely consolidated and made waterproof, and the walls of the south transept nearly so. During the past year the Visiting Abbots' Lodging, a detached building south-east of the church, has been preserved. The west end of the church is now in hand.

Proposed Abattoir at Letchworth.

The foundation stone of a model abattoir has been laid at Letchworth, Herts. The first part will be the pig section, which will cost £10,000. Mr. R. Stephen Ayling, F.R.I.B.A., is the architect.

Middlesex Hospital.

Nearly £250,000 has been subscribed to the Middlesex Hospital Reconstruction Fund towards the £500,000 required.

Bermondsey Housing Scheme.

Plans have been submitted by Messrs. Culpin & Bowers for the erection of 26 new houses in Salisbury-street, Bermondsey, and a revised layout of the whole area. One block will be in the form of a quadrangle, treated mainly in white stucco. The other two blocks will be treated mainly in brick facing, to serve as a foil to the quadrangle. Temporary houses are to be erected on the site of Tanner-street Workhouse, at a cost of £250 per house.

Obituary.

We regret to record the death of Mr. Charles Henry Sampson, F.R.I.B.A., aged 87, of 41, Hillmorton-road, Rugby, and late of Taunton.

We regret also to learn of the death of Mr. Edmund L. Wratten, A.R.I.B.A., late partner in the firm of architects of Messrs. Wratten & Godfrey.

Facilities for Architectural Education and Instruction in Building Construction.

The Board of Architectural Education have appointed a special sub-committee to view and report upon the existing facilities for architectural education and instruction in building construction in institutions other than those exempted from the R.I.B.A. Examinations. This special Sub-committee is now considering the possibility of the development of existing facilities and of the provision of facilities where none at present exist. The Sub-Committee will be glad to receive suggestions or criticisms from

those who are specially interested, together with any information as to existing facilities, stating, if possible, the number of professional students of architecture in attendance at any institution named.

Proposed Cardiff Hospital.

The Cardiff Board of Guardians propose to erect a new hospital at Llandough, at an estimated cost of £300,000. The scheme includes the building of six pavilions, containing 408 beds, at a cost of £177,000.

The Lower Thames Tunnel.

The Traffic Advisory Committee have resolved to urge upon the Ministry of Transport the construction of the Lower Thames tunnel, and ask the reconsideration of a site between the near coast of Tilbury and Gravesend.

A Supposed Tintoretto Discovered.

It is reported from Bellinzona, Canton Ticino, that during repairs in the Cathedral a painting of the Crucifixion has been discovered which some experts attribute to Tintoretto.

Proposed Well at Pontefract.

Pontefract Corporation are seeking powers to enable them to sink a new well and erect the necessary buildings on a site at Eggborough, at an estimated cost of £75,000.

Midlands Electricity Scheme.

An electricity scheme, for which powers are being sought for a capital of £5,000,000, is to be executed in South Staffordshire and a corner of Shropshire. It involves the erection of a super-station at Ironbridge, at a cost of £1,250,000.

Proposed Eastern Church for Hayes.

A new church of the Immaculate Heart of Mary is to be erected at Hayes, Middlesex, by the missionaries of the Order who have charge of the parish. The church will be a unique example in England of the Mudejar style and will cost £20,000.

Proposed New Aerodrome.

The Berechurch Hall Estate at Colchester has been purchased by the War Office. There is a proposal to establish on the estate a new station for the air defence of London. This includes the provision of a large aerodrome and the quartering in Colchester of an anti-aircraft unit. It has been stated that the proposed aerodrome will cost £500,000.

COMPETITION NEWS

Proposed New Parish Church, Newbridge, Monmouthshire.

The Competitions Committee of the R.I.B.A. call the attention of members to the fact that the conditions of this competition are not in accordance with the Regulations of the R.I.B.A. The Competitions Committee are in negotiation with the promoters in the hope of securing an amendment. In the meantime members are advised to take no part in the competition.

Police and Fire Brigade Station, Newcastle-upon-Tyne.

The assessor in this competition, Dr. Percy Scott Worthington, F.R.I.B.A., has made the following awards:—1st (premium £500), Messrs. Ivor Jones & Percy Thomas, A. and F.R.I.B.A., Cardiff; 2nd (premium £300), Mr. E. Vincent Harris, F.R.I.B.A.; 3rd (premium £100), Messrs. Cackett & Burns-Dick, F.R.I.B.A., Newcastle-upon-Tyne.

Proposed Hospital, Blaydon.

The Blaydon, Ryton and Whickham Joint Hospital Committee invite designs for an infectious diseases hospital of 72 beds. Applications must reach Mr. R. H. Tench, Clerk to the Committee, "Hagghill," Blaydon-on-Lyne, on or before December 22.

Proposed Church, Lynemouth.

The designs prepared by Mr. J. J. Eltringham, L.R.I.B.A., of Blackhill, have been placed first in the competition for the new Primitive Methodist Church and Sunday School at Lynemouth, near Ashington. The church will seat 400 people and the Sunday school 350. The estimated cost of the scheme is about £9,000.

Competitions Open.

	Particulars published in "Builder."	Sending in date
Argentine Institute. Premiums 10,000, 6,000, 4,000, 3,000, 2,000 gold pesos. Apply parties, 35, Old Queen-street, S.W.1	April 24	Dec
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool	Aug. 7	1926 Jan.
Houses for Smaller Middle-Classes and Intellectual Workers. Held under auspices of International Federation of Building and Public Works. Prizes: 1st, 500 dollars; 2nd, 300 dollars; 3rd, 200 dollars. Write to Director-General of the International Federation, 17, Avenue Carnot, Paris	Oct. 30	Jan.
Branch Library, Gabalfa, Cardiff. Limited to qualified architects in Cardiff. Premiums 75, 50, and £30. Mr. Sidney K. Greenslade, F.R.I.B.A., assessor. Apply, with deposit of £2 2s., to Librarian, Central Library, Cardiff	Nov. 27	Jan.
Art Gallery and Museum, Birkenhead. Limited to competitors practising within 20 miles of Birkenhead since January 1, 1923. Premiums: £250, £175, £100. Sir Robert Lorimer, A.R.A., assessor. £2 2s. deposit. Apply Curator, Central Public Library, Birkenhead	Oct. 16	Jan.
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London	Aug. 14	Mar.
Royal National Eisteddfod of Wales, Swansea, Competitions: (1) National Parliament House of Wales (Prize, £100); (2) Street Facade to a Large Stores (Prize, £25); (3) Set of Measured Drawings of Architecture (Prize, £25). Apply for programme to publishers, Messrs. Morgan & Higgs, Heathfield-street, Swansea (1s. 2d. post paid). Mr. Arthur Keen, F.R.I.B.A., Assessor	Nov. 6	July 12
Incorporated Architects in Scotland: (1) Rowand Anderson Medal and £100; City Art Gallery and Museum; (2) Rutland Prize (£50) for Study of Materials and Construction; (3) Prize (£10 to £15) for 3rd year Students in Scotland; (4) Maintenance Scholarship, £50 per annum for 3 years. Apply Secretary of the Incorporation, 15, Rutland-square, Edinburgh	Nov. 6	—
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnat being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.	Jan. 2	—
Public Hall, Topsham. Premiums £50, £40, and £30 respectively. Mr. Walter Cave, F.R.I.B.A., assessor. Last day for questions, Jan. 1, 1926. Designs to be sent in by April 1, 1926. Conditions from the Clerk to the Parish Council, Topsham, on deposit of £1 1s.	Jan. 1	April 1
Secondary School for Girls, Worcester. Premiums 100 guineas and 50 guineas. Mr. Herbert T. Buckland, assessor	Dec. 11	—
Public Memorial, Blackpool. Mr. E. Bertram Kirby, F.R.I.B.A., assessor. Apply to Mr. D. L. Harbottle, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.	Dec. 11	Feb. 13

* Competitions when "warned" or vetoed by the R.I.B.A. are starred.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Incorporated Association of Architects and Surveyors.

SIR,—In reference to the formation of this Association, I quite agree that it would be highly desirable to have no other society than the R.I.B.A., but it seems to me that the R.I.B.A. build with one hand and pull down with the other. I myself have been in practice as an architect and surveyor for over twenty years, and have several times applied to the Institute for admission, and every time have been referred to the ordinary examination. Now, a busy man has not the time at his disposal to prepare for this, which in itself keeps a number of first-class men from joining the Institute.

Again, the very strict and high standard of draughtsmanship demanded at these examinations make the attempt almost impossible for a man over 40 years of age, as usually his hand is not steady enough, and I would suggest that while draughtsmanship is in itself highly desirable, it should not be the great aim and finale of architectural examinations as at present. Personally, if I were choosing an assistant, I should place general knowledge, construction, and knowledge of design before draughtsmanship, and I believe the majority of architects would do the same.

It is also a fact that this state of things at the examinations injures the men themselves (viz., the students). Quite recently I heard of a case where three A.R.I.B.A.'s had been dismissed from their posts owing to their lack of essential knowledge and construction, and this certainly points out the great weakness of the R.I.B.A. examinations and the urgent need of reform. If the R.I.B.A. wishes to remain the only architectural institution, it must revise its methods, especially the examination with reference to men of over 40 years of age who have been in practice as architects for over 10 years, and who have a reputation which cannot be denied.

CRITIC.

SIR,—It is common knowledge that the I.A.A.S. was founded by the recently formed National Association of Auctioneers and Estate Agents with a view presumably to extending its scope of representation in opposition to the proposed Landed Property Practitioners (Registration) Bill, which is, or was, being promoted by the senior representative bodies of auctioneers and surveyors. Possibly the Association also had in mind the Architects' Registration Bill to be promoted by the R.I.B.A.

If your analysis of the personnel of the Council of the newly-formed Association may be taken as indicating its general scope it would seem that its already somewhat unwieldy title ought to be considerably extended in order adequately to display its ramifications, which would appear to extend to auctioneers, valuers, barristers, town clerks and members of other callings.

Indeed, the form of application for admission indicates that it is no bar to membership of the I.A.A.S., but even a recommendation, that a candidate should combine some other calling with that of an architect and/or surveyor, and it remains to be seen whether unattached architects who practise their profession solely and are therefore eligible to qualify for admission to the R.I.B.A. will allow themselves to be drawn into the new Association.

The I.A.A.S. is entitled to every credit for seizing the psychological moment for its formation and for its enterprise in utilising the Registration proposals as a means for augmenting its ranks. Had the R.I.B.A. in pursuit of its Registration policy and when altering its Charter, been equally astute and foreseeing and opened its doors a little wider for a time, until it had absorbed the unattached architects entitled to be registered under its proposed Act, there would

have been no opening for a new architectural society.

The circular on the subject issued by the R.I.B.A. to its members on November 30 may or may not reach those architects who do not belong to it, but who are members of its allied Societies. It would have had greater force if it had been circulated to the whole profession, pointing out that not only can eligible unattached architects join the Allied Societies, but that entrance to the Institute through the usual channels remains open to any eligible candidate. The circular is calculated to give the unattached architect the opposite impression on this point.

The Institute cannot control unattached architects, but it should be able to command the loyal support of the members of its own body and of its Allied Societies, and if, as would seem to be the case, some members of the Institute have joined the new Association for the purpose of protecting their interests in the event of Registration, they are obviously violating their obligations of loyalty to the R.I.B.A. and should be called to account for obstructing and hampering the attainment of one of its objects.

OBSERVER.

The Theory of Architecture.

SIR,—In these days of critical analysis when most new buildings of importance in London and elsewhere are submitted to the fire of criticism, commendatory or otherwise, in the professional Press and more and more so in the lay Press, it would seem a pity that students are not required to pass some test in the theory of architecture pure and simple. It is a moot point whether those students who are passing through the principal schools are conversant with what might be termed shortly "the reason why and the reason why not" certain things are done or not done in academic design. It is true that the student of these schools at the completion of his course may be expected to keep within the canons of good taste and design, having emerged from an environment which aims ostensibly at these ideals, and subjected to a subconscious influence he could not very well avoid. On the other hand, his output of work may be the result of a parrot-like repetition of exercises and fulfilment of what is expected of him or any other student, but it is doubtful if he were questioned on the subject of fundamental architectural analysis, which, after all, is the very quintessence of the art, whether he would not be found wanting. If it could be suggested to the Board of Architectural Education, would it not be preferable to delete from the syllabus of the Intermediate Examination the specialised paper on history, and to substitute a paper on the theory of architecture, and increase the standard of the general history paper in order to make up for the loss of the specialised history? Furthermore, in the Final Examination, if an extra paper on theory were inserted, the result would be rather astonishing. I am not likely to be thanked for prolonging the agony at either of these examinations, and for which, together with any sort of examination, I have a profound terror—though reluctantly at the same time realising the necessity for them. Still, after all, the examiners would be able to obtain a very clear insight into what must constitute a very important part of the make-up of an architect.

Unfortunately, the literature dealing directly with the subject is not very profuse, but what with Mr. Howard Robertson's excellent book, and Cortlandt van Curtis, to say nothing of Guadet's "Elements et Theorie d'Architecture," Mr. Trystan Edwards's "Architectural Style," Van Pelt's "Essentials of Composition," &c., there is sufficient material that would throw a very different complexion on the subject from the point of view of the student.

W. MARTIN KAYE, A.R.I.B.A.
School of Arts and Crafts, Southend.

Tourist Guide Maps.

SIR,—It is now generally reported that the numbers of tourists and travellers to places of interest in this country are steadily growing; and, moreover, it seems that the majority of these tourists are paying more attention to the

historical and architectural features of places they visit than did their predecessors. Here, it would appear, is an opportunity providing a section of the general public with that instruction and guidance on architectural matters which all who are interested in improvement of the art so ardently desire to see given. In this connection, we are constantly hearing expressions of opinion to the effect that there can be no very general improvement in the architecture of our country until the public have a truer and better understanding of the subject.

With the object of contributing in a measure to the achievement of this end, it is suggested that tourist guide-maps should be prepared showing the locations of existing buildings more than ordinary architectural interest or excellence. Buildings erected within some finite term of years could be marked in a particular colour, separate colours being used for each epoch in the architectural history of town or district. The coloured marks could be either small dots or rectangles, adjacent to the buildings which would be placed for purposes of reference the name of the building or its street number. These maps could be produced with but little alteration to existing appliances: the printers of tourist maps.

Two courses are open:—

(1) The maps for each town or district could be issued in the form of sheets folded into a convenient size, accompanied by a book of simple architectural, and perhaps also historical, information, the latter being bound with the map or printed on back of same.

(2) The above-mentioned marks of identification and the information accompanying them could be added to the maps and printed matter which is already issued in the form of guide books for tourists and travellers.

With the object of interesting the greater number of tourists, and hence ensuring a rapid return on the outlay incurred in producing the maps and notes, it is obviously desirable to commence with London and to extend the series to other towns and districts of outstanding architectural importance.

T. W. MACARPINE.

London Underground Schemes.

Schemes designed to facilitate North London traffic are announced by the Metropolitan Railway. Subject to Parliamentary powers being obtained in cases where these are required, the following work is to be put in hand:—New tube and tube to give direct connection between Willesden-green and Edgware-road, and the tube to the City; erection of three stations on the line at convenient points within the boroughs of Hampstead, Paddington and Marylebone; enlargement of Edgware-road Station, with provision of four platforms; and opening of a disused tunnel and a new companion tunnel between Euston-square and King's Cross, and electrification of the steam lines parallel with the Inner Circle track between King's Cross and Moorgate.

Beebles Archæological Discovery.

An archæological find at Beebles includes a vaulted crypt, rectangular in shape, measuring 10 ft. 6 in. across, 6 ft. deep, and about 7 ft. high, the top of the arch, and containing a well-preserved piscina and ambry. The ribs appear to be Perpendicular work of the sixteenth century. They are built of small Tudor brick with chamfered edges, resting on four corbels ornamented with a roll of hollows.

Memorial to Lord Leopold Mountbatten.

At a time when many cathedrals and churches have been disfigured by over-elaborate and unduly large war memorials, the tablet recently placed in the south aisle of the choir of Winchester Cathedral to the memory of Lord Leopold Mountbatten sets a good example. This tablet does not measure more than 22 in. high by 10 in. across. It is made of marble and blends happily with the surrounding walls and the lettering is well chosen. The artist responsible is Mr. C. E. Kempe.

Mr. E. GUY DAWBER (President) occupied the chair at a meeting of the Royal Institute of British Architects on Monday, when Herbert A. Welch read a paper entitled "The Condition of the Building Industry, with Special Regard to the Shortage of Skilled Labour and the Increased Cost of Work."

Obituary.

Before the paper was read, the Honorary Secretary announced the decease of Mr. E. S. (Fellow); Mr. W. H. Harrison (Fellow); Mr. E. L. Wratten (Fellow); Mr. C. A. (Fellow); Mr. E. Garlick (Fellow); and Mr. Arthur Benjamin (Fellow). Mr. Plummer was a Past-President of the Northern Architectural Association and represented that body on the R.B.A. Council during the Session 1907-8. Prior to his Presidency Mr. Plummer had for fourteen years Hon. Secretary of the Northern Architectural Association.

CONDITION OF THE BUILDING INDUSTRY.

In the course of his paper Mr. Welch said that on one previous occasion only, he thought, in recent years had the Council of the Institute considered it opportune that its members and other parties interested should, in those walls, be given an opportunity to draw their attention upon a matter having for its purpose a general survey of the condition of the building industry, with a view to determine whether the existing difficulties with which the industry was beset could be overcome to the lasting satisfaction of all concerned. Resulting from his investigations, he formed the opinion that the chronic troubles from which the industry had suffered in recent years were not so much due to particular incidents or disputes, to special points of difference between the parties regarded, but that at such times appear to be the cause for such disputes, as to the fact that there was underlying these disputes a deeply seated feeling (frequently shared by both employers and men) that hardships and grievances were permitted to continue because no efficient attempt had been made in the past to tackle fundamental conditions. On this point many of the so-called settlements of disputes had in effect been merely a postponement of the matter until such time as the one side or the other considered the occasion favourable to its cause. The result had been that for a long time "feeling"—active or latent—had manifested itself within the industry. In such cases delay had not healed the wound but, on the contrary, caused it to fester with a tendency to become poisonous. The existing agreements between the employers and employees would expire in January of next year. It would seem, therefore, that now was the opportune time to give a quiet and deliberate thought to the subject. For some time past there had been an expressed desire for "a new spirit in industry" generally. Could we continue to view with complacent satisfaction this growing deterioration without ourselves making a serious attempt to encourage this new spirit within the industry?

For the best work there must be an adequate motive, and it would not be forthcoming without a change both in the human and in the economic relationship. The first concerned personal treatment. Authority and discipline there must be in all concerted operations; but they could be exercised in different ways, as they actually were in different establishments. In some there was incessant trouble, in others none at all. In the former case employers put it all down to agitation (and sometimes that was a principal cause), but more often it was due to someone wielding authority and exercising it in a harsh manner. To be effective the change of attitude must be generally recognised and observed. With regard to the economic relationship, what was needed was such an interest in the prosperity of the business as would induce all those engaged in it to do their best, or at least such a direct reward for effort as would elicit the best. A combination of the two was the most complete solution of the problem. It was in this direction that American industry had taken so marked a lead. Effort was encouraged and interest in the common prosperity secured by commensurate reward.

To give and to receive the fullest measure of benefit the industry as a whole should be happy and contented, the crafts sound and skilful; production should be smooth, steady and economic. Could architects play any useful part in creating such conditions? In the past attempts had been made to this end. These attempts, however, had failed to achieve any great measure of success. Trying to forget the past, was the time ripe to make a further and this time a successful effort to get together and pull together in an attempt to improve conditions and remove evils which were known to exist?

The speaker then quoted a long letter by Mr. Robert D. Kohn, Chairman of the Committee on Industrial Relations, American Institute of Architects, in the *Architectural Association Journal*, dated June 19, 1925, which showed how the problem had been tackled by a Congress of the Building Industry in the United States. He could not help feeling, he continued, that if possessed of "the will to win," a similar body set up in this country could and would do much excellent work. He further felt that unless some such body was created, and could be made to work in the right spirit, we must be prepared to face in the future continued trouble and controversy.

He could not speak for his friends the quantity surveyors, but believed he was expressing the feelings of the R.I.B.A. when he said that they now were, as they had always been, ready and willing to play an earnest part in any such movement. Clearly they could not move alone, nor of their own initiative, but if an invitation was extended to them by the other interested parties they should not decline to give of their best to help in a further endeavour to find a way to lasting peace and prosperity in the industry.

The main causes for the difficulties and dissatisfaction within the industry might be comprehensively grouped under five heads:—(1) Shortage of skilled labour; (2) casual nature of employment; (3) wet time; (4) output; (5) high costs. The marked shortage of skilled labour had manifested itself mainly since the war—it had, however, been going on since at least 1901—and was at once the direct or indirect cause of many of the other difficulties in the industry. There were engaged in the industry in 1921, 168,853 fewer skilled operatives than in 1901 representing a general decrease of about 24 per cent. There was a decrease in the various crafts as follows:—

		About
	Decrease.	per cent.
Bricklayers	28,558 ..	24
Masons	42,289 ..	61
Carpenters and Joiners ..	64,735 ..	24
Plasterers	11,500 ..	34
Painters and Decorators ..	5,959 ..	4
Plumbers.....	15,805 ..	24

Where the supply of prospective labour was short the principal reasons given why young men did not enter the industry were stated to be as follows:—(1) The casual nature of employment. (2) The comparatively low level of net wage—having regard to time lost during the year owing to the casual nature of employment, insecurity of tenure, "wet time," and other causes. (3) The small increase of wages of skilled men over the wages paid to unskilled workers, and to the relatively high wages obtainable by unskilled boys in what might be termed "blind alley" occupations. (4) National unemployment pay for persons under 21 years of age. (5) The supposed social inferiority of workers in manual trades generally.

All these objections could with co-operation and determination be mitigated or overcome. In an attempt to discover the most satisfactory solution to the problem of shortage, with which was closely allied the general improvement of conditions within the industry, five possible methods of entry into the industry might be examined:—(1) Apprenticeship to a building trade employer. (2) Tuition in a trade school, including indentures. (3) Over age apprenticeship. (4) Promotion from labourers. (5) Dilution. Of these five methods Nos. 1 and 2 appeared to offer the most satisfactory means whereby the shortage could be overtaken. From the examination of much data he had formed the opinion that hitherto the system of apprenticeship had not been developed to nearly its full extent. The fullest possible development of the apprenticeship system, together with that of training in technical schools was both urgent and vital if the existing shortage was to be supplemented by bringing into the industry the right type of young man.

At the present time there existed between the employers and employees an arrangement by which no employer might engage apprentices in any craft in excess of one to seven of the journeymen employed by him, with a maximum of eight apprentices in each craft. To the credit of the parties to the agreement it should be stated that this limitation had not been too rigidly observed, or the position to-day would be worse than it was. Yet whereas in certain cases a greater proportion of apprentices had been agreed to at the instigation of certain firms—in consequence of which a greater number of apprentices were now being trained than probably at any time during recent years—there existed, nevertheless, a real difficulty in obtaining in sufficient numbers lads to follow the various trade crafts in the industry, with the single exception of the carpentering and joinery craft. So far as could be ascertained there were at present in London about 800 lads serving the usual five years apprenticeship course in the various crafts, 160 of whom (on average) would be available each year as journeymen. In addition there were about the same number of improvers, mainly boys without indentures and others, who were suffering some measure of disability. In addition there were in the various trade schools about 140 to 160 lads being trained for a period of three years. This, on an average, would indicate a total number of about 370 young journeymen likely to enter the various crafts in the London area each year. The wastage from various causes he computed to be about 800 to 1,000 journeymen each year. It would therefore be seen that at the present rate about 33 per cent. only of the normal vacancies could be filled.

In order to increase the number of apprentices with a view to overtaking the existing shortage of labour, it would, he thought, be well to consider—at least for a stated period of, say, 5 years—(a) the advisability of amending the existing rules in order that individual firms might take an unlimited number of apprentices, provided the agreed ratio of apprentices to journeymen (1 to 7) was not thereby exceeded; (b) That the Employers' Federation should bring to the notice of its members in particular and to the industry in general the vital necessity of encouraging the apprenticeship system by urging master builders to train a greater number of young men in the various crafts, in particular those crafts in which from time to time the

shortage of skilled workers was most marked; (c) that the notice of the elementary school authorities be drawn to the prospects in the industry for young lads when nearing the age for leaving school. In this direction stimulus might be provided if suitable propaganda work were undertaken in important centres of population; (d) that greater encouragement be given to apprentices to supplement the knowledge gained in the workshops and on the jobs by attendance at technical schools at least on certain evenings each week, and if possible one whole day a week during, say, the three or four years of their apprenticeship. It was generally acknowledged that operatives who had received technical school training in addition to working in the shops and on the job became far better fitted ultimately to occupy the positions of foremen, clerks of works and master builders. To this end added encouragement would be given if the Federations of Employers and Employees could see their way to grant a suitable sum for prizes and scholarships to students at recognised schools. He would add that in the event of the Federations adopting some such scheme perhaps the Council of the R.I.B.A. might consider the desirability of associating itself with such an educational project. In cases where an apprentice showed marked ability and progress as a result of supplementing workshop training with technical school study, his period of apprenticeship might be accordingly reduced; (e) that wages paid to apprentices should not bear unfavourable comparison with those obtainable by lads in unskilled trades.

(3) Over-age apprenticeship had, he believed, had some measure of consideration as a temporary means of providing additional craftsmen. By this method the prospective craftsman would be bound under a form of indenture providing for a minimum period of three years training. Of this period it appeared to be advisable that one year at least should be spent in a trade school, where a curriculum suited to this special section should be applied. Owing to the comparatively high age—say 19-25 years—for the commencement of such indentures, some system of payment by grant would be necessary, and this might involve a difficulty not easy to overcome, especially in view of the comparatively small numbers of craftsmen likely to be produced by such an arrangement.

(4) and (5). Promotion from labourers and Dilution.—This was a scheme for increasing the number of craftsmen in the industry by introducing into the ranks of the skilled craftsmen a number of semi-skilled men, thereby creating additional numbers of so-called skilled workers, many of whom were not necessarily capable of executing a high standard of work. If such a scheme were adopted on anything approaching a big scale, he feared that the dilutees would fail to get general employment on account (a) of the established tradition for a high standard of workmanship in the industry, (b) the disinclination of architects to produce a specification of works on a lower standard than that to which they were accustomed, and (c) the comparative failure of the scheme of dilution for ex-Service men put into operation a few years ago.

(2) Casual Nature of Employment.

On this point the lecturer asked: (a) Could not a building trade employment bureau be set up in all large centres of population whereby employers seeking men and operatives seeking employment could obtain mutual advantages?

(b) It had become a custom with the public to view with favour the early spring for carrying out all kinds of decorations and jobbing work. These seasonal operations needed adjustment in the interests alike of the public and the industry. Organisation and outlook could do much to reduce casual employment.

(3) Wet time.

For many years this had been a vexed question and the cause of constant irritation within the industry. On the face of it, it certainly seemed a hardship that a section of the community should be penalised because of the misbehaviour of the weather. On the other hand the "dole" had made evident to all clear-

thinking people the ill effect upon human nature of substantial payment for no work. Every good foreman so arranged the execution of his job that there was in reserve under cover certain work which was done at odd times by men who would otherwise be adversely affected by wet weather. Would not a temporary covering over the building at once reduce wet time to a minimum, increase output generally and lessen costs by reducing the time needed to carry out a job?

Feeling that something more equitable might with co-operation be done, a group of architects after extensive enquiries found that a master builder in the London area had put into operation a scheme whereby all men should be paid 1s. per hour when bad weather prevented work. The builder employed on an average between 75 and 100 men. The scheme was arranged on an experimental basis by joint contributions of 6d. per week from every man employed, to which the builder added 3d. per week per man. After more than two years' working it was found that the amount paid out as "wet time" wages did not exceed the 3d. per week contributed by the employer, and during the two years a balance had accumulated amounting to about £185. This money had been used to give the men a holiday of two or three extra days—at Bank Holiday time—drawing their pay from the fund at the rate of 1s. 6d. per hour, thereby providing an unexpected opportunity for the men, together with their families, to get away for a change. He was happy to hear that arrangements acceptable to both parties were nearing completion in regard to an official scheme for dealing with this matter.

(4) Output.

To reach maximum output maximum effort must be made by both sides working in unison. Every facility as well as reward must be given to accomplish this. There must be ample materials on the job—for obvious reasons a scarcity of materials tended to slacken progress. Architects also could help considerably to this end. He doubted if architects realised to what extent the early delivery of their $\frac{1}{2}$ in. and F.S. details, the early placing of orders for specialists and sub-contractors' goods and other matters in their control, helped the builder and in turn the operative in the economic working of the job. In addition, the operations of the various trades must by foresight be made to dovetail into each other on the job without causing waste of time and a few days' "stand off."

(5) The Increased Cost of Building Work.

The main factors in the cost of building work might be set down broadly under four heads:—

(1) Wages, (2) Materials, (3) Overhead Charges, (4) Profit, in the approximate ratio of 48 per cent., 35 per cent., 7 per cent. and 10 per cent. respectively. These figures would, of course, vary in each separate job. The total increase in the cost of building work to-day compared with 1914 was approximately 105 to 110 per cent. The wages of operatives in the various sub-contracting trades might be said to have increased at about the same rate. The general increase over the whole of the trades would therefore be about 93 to 94 per cent. These figures, however, did not indicate the total increase of wages on any particular job, which must clearly be governed by the proportion of labourers, painters, and scaffolders (whose percentage of increase was the highest) in relation to the other workers engaged upon the job.

The following table showed the approximate cost of certain building materials generally in use in 1914 and 1925:—

Materials.	1914.	1925.	Increase per cent.
Blue Lias lime (ton)	21/- ..	58/6 ..	179
Stock bricks (1000)	40/- ..	98/6 ..	146
Deal—Carpentry ft. cube	1/4 ..	3/3 ..	144
Joinery, ft. cube ..	2/6 ..	6/- ..	140
Tiles (1,000 of 1,200)	52/6 ..	120/- ..	129
Bath stone, ft. cube	1/8 ..	3/8 ..	120

Materials.	1914.	1925.	Increase per cent.
York stone, ft. cube	2/10 ..	6/3 ..	120
Fletton bricks (1,000)	28/- ..	60/- ..	114
Portland stone, ft. cb.	2/6 ..	5/3 ..	110
Sheet lead, cwt.	25/- ..	50/- ..	100
Slates (1,000 of 1,200)	225/- ..	430/- ..	90
Sand (yd.)	7/- ..	13/- ..	81
Paint (cwt.)	46/- ..	82/9 ..	81
Thames ballast (yd.)	6/6 ..	10/- ..	54
Steel joists (ton)	170/- ..	260/- ..	35
Portland cement (ton)	48/6 ..	60/9 ..	25

In an endeavour to arrive at a general increase in the cost of materials it would be misleading to take all the above materials into account, for the reason that in an exceptional case one would they all be in use on one job. He had therefore, by a series of calculations, endeavoured to arrive at an equitable figure which showed the increase to be approximately 100 per cent.

They must now proceed a further stage, in order to ascertain the effect of these increases on the cost of work. The table following gives figures compiled by a firm of quantity surveyors showing in detail the approximate prime cost of materials and labour required in a rod of common brickwork in cement in 1914 and 1925:—

1914.	£ s. d.
4,300 Flettons at 28/- per man....	6 0 0
Unloading, &c., and stacking—labourer, 6 hours at 8d.	0 4 0
3 yards sand at 7/-	1 1 0
1 ton cement at 48/6	2 8 0
Labour mixing—10 hours at 8d.	0 6 8
Scaffolding—Use and Waste	0 1 3
Labour, 7 hours	0 5 3
Bricklayer, 43 hours at 11½d.	2 1 2
Labourer, 26 hours at 8d.	0 17 4

1914—Prime Cost£13 5 7

1925.	£ s. d.
4,300 Flettons at 60/-	12 18 0
Unloading, &c., 7 hours at 1/4½	0 9 7
3 yards sand at 15/-	1 19 0
1 ton cement at 60/9	3 0 0
Labour mixing—13 hours at 1/4½	0 17 10
Scaffolding—Use and waste	0 2 6
Labour, 9 hours at 1/5½	0 13 1
Bricklayer, 57 hours at 1/9½	5 2 1
Labourer, 34 hours at 1/4½	2 6 9

1925—Prime Cost£27 9 9

The table showed that labour costs had increased 2½ times, and materials rather less than twice.

It disclosed a further matter of interest viz., that whereas in 1914 the time allowed for these costs for a bricklayer was 43 hours and for labourers (including scaffolders) 49 hours, in 1925 the time allowed for bricklayers had increased to 57 hours and labourers to 63 hours. From the above table it would be further noted that if the bricklayers and labourers would build brickwork in 1925 at the same rate as in 1914 there would be saving of £2 4s. 6d. per rod or 24 per cent.—at to-day's wages, and if addition profit, overhead charges, &c., would accordingly be reduced. This seemed to be a clear indication that there were at least some men in the boat who were not pulling their weight.

DISCUSSION.

In the ensuing discussion MAJOR HARRY BARNES said it was all to the good that the Institute should have shown, by Mr. Welch's paper, that it was alive to the human and economic side of the industry as well as artistic and he hoped the paper would help to bring about real co-ordination between architects, builders and operatives. He would like to see the operatives' Federation approach the Institute with a suggestion that they should form a joint consultative board on which they could discuss their common interests. The outstanding problem of the day was the shortage of skilled labour, and he sometimes wondered whether that position would ever be remedied. It seemed to him that people were more and more tending to keep away from the more

ious occupations and seeking to live in the best way open to them. Attention had been drawn to the fact that the output was less now than in the past, and it might be that that situation also could not be remedied. Output is measured in terms of physical energy, and the operatives showed a desire to spend less energy on their daily work in order to be able to try some over to their leisure time. It might be that this change was inevitable, and that if they wanted increased output they must look for it in improved mechanical methods rather than in increased human physical energy. It had been stated that labour was subject to the law of supply and demand, and he felt sure that so long as labour was looked at in that light, they must expect those who were in control of the organisations of labour to take advantage of that law. If labour were to be considered solely in that light they must expect the supply to be restricted so as to get a better price for what was available. If wages had been regulated during the past few years solely by the law of supply and demand, they might have expected to see the wages of the bricklayer and plasterer increase more than the wages of the painter, but it was found that the painters, who were the most numerous of all the crafts, had received the highest rate of increase. He thought the falling off in the numbers of the bricklayers and plasterers was because neither of them was an attractive trade, and boys would prefer to be carpenters and joiners, yet the statistics showed that the falling off was as great among carpenters as among bricklayers.

MR. W. H. NICHOLLS (Past-President of the National Federation of Building Trade Employers) said throughout the paper there was expressed an earnest desire that architects should take a larger share in the affairs of the building industry. The building employers would have everything to gain from such an arrangement. The building industry had always been very self-contained so far as its government was concerned; the general public heard a great deal about its disagreements, but hardly anything about the very large number of things they had found it possible to agree upon. He was glad architects were realising the need for increasing the volume of labour available. The shortage was not the fault of the builders; architects themselves were largely to blame for not regulating the demand so that work would be of a more continuous nature. When the demand for building work was at one time x , at another time $x+5$, and at another $x-5$, it was extremely difficult for the builder to maintain a constant supply of labour or to indenture apprentices. That hindered the industry more than anything else was the competitive system of obtaining work. They all aimed to produce the best work they could, but the competition of the business world tended to produce the worst. Competition, under which the lowest tender was accepted, thought about the desire to do the least amount of work, and the success of a business was often the result, not of the best effort, but of being able to give the least value for the money received. The problem was a difficult one, of which he could not see the solution under the present system of tendering. As to the figures given in the paper on the cost of brickwork, if they included the increased cost due to legislation they would be about right; but if the on-costs included only establishment charges and profit they would be too high. For a long time the best of the employers in this country had been endeavouring to educate the industry as to the need for encouraging the apprenticeship system, and on this question they had received nothing but goodwill from the operatives. They could not view with unconcern the fact that the best brains of the country were going to other industries, and it was probable that the flat rate of wages in force in the building industry was largely responsible for this state of affairs.

MR. R. COPPOCK (Secretary of the National Federation of Building Trades Operatives), said the operatives believed they were entitled to their little leisure and would never go back to the conditions of 1914. Conditions were so bad in

1914 that it was hardly fair to make a comparison of wages and output then with the present time. In 1914, labour was cheap and the result was that the work of that period looked cheap. The operatives would be very pleased to have the assistance of architects, although the operatives had always held the opinion that architects were opposed to them. For instance, when they were discussing wages, the builders told them that a lower rate was necessary as architects said that the cost of building was too high for work to be put in hand. They had to get away from the bad conditions if they were to attract boys to the industry. There was a tendency for youths to try to get away from arduous occupations, for which the present educational system, which seemed to encourage clerical workers only, was very largely responsible. They had been talking about the problem of "wet time" for five years, and were still talking about it; that was a question the industry had got to tackle; it might add a little to the cost of building, but in comparison with the hardship and suffering it would alleviate it would be cheap. Buildings had, in fact, in the past been too cheap. The operatives wanted to participate in the industry; certainly now, with no voice in the matter at all, they could not be held responsible for any of the things which were wrong in the industry. The operatives believed in the flat rate of payment; they believed that the particular trade in which the operatives found themselves was more or less an accident, and that because a man was a painter he should not receive less wages than a bricklayer. They thought payment by results would be most unfair to the operatives, as they feared the rates would be fixed on the basis of the work of the younger men and the older ones turned adrift. The operatives pledged their faith in increasing the amount of labour by recruiting apprentices between the ages of fourteen and sixteen, as boys of that age always turned out to be the best craftsmen. Every effort had been made by both employers and operatives to add to the ranks of the plasterers, but it had been found impossible to attract boys to that trade on account of its arduous nature; he did not think extra wages would have the desired effect.

MR. GEORGE HICKS (Secretary of the Amalgamated Union of Building Trade Workers), said the casual nature of building work was a great deterrent to young boys, and this was added to by the fact that extra wages were lost

on account of "wet time." The cost of paying for time lost during inclement weather had been found to be ridiculously low, and he was convinced the fears at present entertained would disappear if a scheme were put in operation. In regard to the figures of output given in the paper, these did not appear to be in accord with the facts. In 1924 there were 25,000 fewer bricklayers in Great Britain than in 1914, yet 2,000,000,000 more bricks were laid; in 1914, the number of bricks made in this country or imported was 3,000 million; whereas in 1924 the figure was 5,000 million, so that 25,000 fewer bricklayers laid 2,000 million more bricks. He welcomed any co-operation between architects and operatives that might be possible.

MR. FRED THORNE (President of the London Master Builders' Association), said it had been stated that there was an agreement that builders should only take one apprentice to seven operatives, but as a matter of fact in London there was an agreement that they should have one apprentice to every four operatives. The Building Industries Committee had agreed that the proportion should be one in three, but it was to be regretted that this was not being taken up as well as they had expected.

MR. J. MURREY (Secretary of the London District of the National Federation of Building Trade Operatives), said the figures given in the paper relating to labour were misleading. According to the returns issued by the Employment Exchanges, which were a very reliable guide, there were 20,000 more carpenters in the industry to-day than in 1914. If the facilities for training apprentices were taken full advantage of there would be something like 7,000 or 8,000 apprentices in London to-day; he did not suppose, however, there were 2,000. It was true skilled men did not now come to London from the provinces, but if the facilities already available for training apprentices were taken advantage of the shortage would soon disappear. He thought the cost of building could be reduced if building jobs were better organised, so that work under cover were available for men in inclement weather, and this would also remove to some extent the casual nature of the industry.

MR. MAURICE WEBB outlined a scheme which had been adopted by a London builder for payment during wet time, and stated that it had been found that the sum of 3d. per man was sufficient to pay 1s. an hour for time lost through this cause.

Euston Hall Bridge, Thetford.

This bridge is constructed in reinforced concrete throughout, and spans the Little Ouse, at Euston Hall, being a private bridge forming the approach to the Hall, the seat of His Grace the Duke of Grafton. Mr. Kenworthy, Assoc.M.Inst.C.E., of Norwich and Westminster, was the consulting and designing engineer, and the contractors were Messrs. Christiani & Nielson, also of Westminster. With its wing approaches the structure is

practically 115 ft. long. The foundations gave a considerable amount of trouble as the river bed was found to consist of running sand, and piling had to be resorted to, reinforced concrete piles formed of quick setting ferrocrete cement being used for the purpose. The arched ribs and the parapet itself are covered with, or made solid in, Atlas White cement. The bridge replaces an old oak bridge about 60 years old.

New General Hospital, Singapore.

The first portion of this hospital, comprising nurses' quarters, bedrooms for sisters, nurses and probationers, together with recreation rooms, sitting rooms and lavatory accommodation, was illustrated in our issue for October 31, 1924. We now illustrate the European section of the Hospital. Major P. H. Keys, F.R.I.B.A., is the architect.

Lady Altar and Reredos, Church of St. Edward the Confessor, Golders Green.
MESSRS. ARTHUR YOUNG & ALLAN D. REID Architects.

Branch Library: Sheffield.

THIS projected building will form part of the Corporation scheme for the extension of permanent library facilities to districts of the city not at present provided for. The library will be mainly single story, with heating chamber and store-room in basement, and repairing, &c., room on mezzanine. It includes reading-room, juvenile library, special study room, and staff accommodation. The lending department is planned on the open-access system, which has been installed and is working successfully at the Central Library and several existing branches. Local stone will be used for the external facing of walls, flat roofs being of reinforced concrete. The estimated cost, including fittings, is about £20,000. The architect is Mr. F. E. P. Edwards, F.R.I.B.A.

Addingham Church, Yorkshire.

ADDINGHAM is situated on the edge of the Yorkshire Moors, about three miles from Bolton Priory. It is an old Roman station (the tribal camp of the family of Adding), and the Roman street and Roman camp may still be seen. The church is on an eminence above the river Wharfe, and is probably on a very ancient foundation, although the oldest part of the existing edifice is not earlier than the fifteenth century. The south wall was taken down and rebuilt about the middle of the eighteenth century. The chancel was built about 60 years ago. One of the most interesting features of the church is the nave arcade, the wall above being thinner than the pillars. Another interesting detail is a wall

3 ft. thick between the chancel and the nave, the upper part of which is reduced to half the thickness. There is a mediæval roof, entirely hidden by a plaster flat ceiling. Our reproduction is from a drawing by Mr. W. Hoffmann Wood.

Low Hill Estate, Wolverhampton.

We illustrate in this issue the first part of a large estate purchased by the Corporation of Wolverhampton, for the erection of houses. It comprises three farms, namely Low Hill Farm, Old Fallings Farm, and Show Farm, with a total acreage of approximately 400 acres. The land is situated just outside the Borough, in the parish of Bushbury, about 2 miles from the centre of Wolverhampton, and is easily accessible by three routes of the Corporation motor bus services. The portion illustrated consists of about 289 acres, which has been divided as follows: 187 acres of houses, 46 for roads, 10 for shops and public buildings, and 47 for open spaces. The total approximate acreage of the entire scheme is 506 acres, number of houses, 4,300 (10 to 1 acre), area of roads 86 acres, and area of open spaces, 84 acres. The contract for the roads, being carried out by Mr. M. A. Boswell, Wolverhampton. Separate foul sewerage and storm water sewers are being laid. The lighting (for roads and houses) will be by electricity. The number of houses to be built on this portion of the estate is 1,600 non-parlour type and 840 parlour type, making a total of 2,526, and the cost of land and roadwork per house is estimated at about £50. The non-parlour type houses consist of two types marked "A" and "B," and the parlour type marked "B." Contracts for 1,500 houses have already been let. Mr. A. M. Griffiths, of Wolverhampton, is building 500 brick houses at £440 per house for parlour type, and £370 per house for non-parlour type. The remaining 1,000 are to be built in concrete by Mr. M. A. Boswell, whose prices are £440 for parlour type and £400 for non-parlour type. All these prices include hot water service, electric lighting, gas service for cookers and gas boilers, fencing, paths, &c. Mr. Wallis Wood is the architect for the scheme, and the whole work is being carried out under the supervision of the Borough Engineer and Director of Housing, Mr. George Green, M.Inst.C.E.

A Colour Front.

This subject was prepared as a study for the treatment of the facade to business premises in terra-cotta tiles and glass mosaic, the predominant colour applied to the upper store being blue and gold. Mr. F. J. Horth, A.R.I.B.A. (Messrs Horth & Andrews), is the architect.

Church of St. Edward the Confessor, Golders Green.

Some recent work in this church is illustrated. The high altar itself is 10 ft. long, and the total length over the Gradine is 12 ft. The front is divided into five panels, and the carvings represent the four Evangelists and the Lamb of God. The work was carried out by the Bath & Portland Stone Firms, Ltd., in Bath stone. The reredos, a memorial to the late Fr. Bendon, is also Bath stone. The central throne and canopy are very richly carved. This work was carried out by Messrs. R. L. Boulton & Sons, of Cheltenham. The Lady Altar and Reredos is the latest addition to the church. The stone work, of Bath stone, was carried out by the Bath & Portland Stone Firms, Ltd. The oak reredos is by Messrs. Robinson, of Westminster. The statues of Our Lady, St. Anne and St. Joachim, and the shields and monogram on the altar front were carved by Mr. James Walker. These figures and the two panels representing the Annunciation and The Visitation were designed by Mrs. Norah E. L. Reid, A.R.C.A., who also painted the panels. The decoration of the statues, &c., is by Mr. Charles Powell, of Highgate. The architects are Messrs. Arthur Young & Allan D. Reid.

Newcastle Police and Fire Station Competition.
We illustrate this week the winning design in this competition, by Messrs. Ivor Jones & Percy Thomas, A. & F.R.I.B.A. The full awards are given on page 872.

ROYAL ACADEMY STUDENTS' COMPETITION

It is a pleasure to chronicle the success of the student who has this year won the Royal Academy Gold Medal and Travelling Studentship, because it is one of the most genuine successes of recent years. A mere success as to beating one's fellow-competitors may not mean a very real and striking success in design; and to tell the truth this has far too often been the case. If we venture to form a judgment on the capacity of the winner of this important prize this year by an inspection of his drawings we should say he has within him the making of a designer of exceptional ability, for the quality of his drawings suggests a genuine feeling for the delicacies and refinements of the Greek type of design he has adopted, and the general effect of breadth and simplicity which he has obtained is allied with some genuine distinction of both plan and elevation. When we follow the design in its detailed exposition we feel that the designer has something of value to say beyond the mere general form and mass of the building. A great asset to the success of the whole is its admirable presentation and we think it is doubtful if ever a better quality of drawing has been shown. Judging by the principal elevation we should hardly venture on any criticism of parts or the whole, but when we look at the perspective we find that what shows an admirable effect in elevation is woefully astray in the perspective of the central block. It is one of the usual mistakes of architects in drawing the elevation to the effect they would like to see in perspective, and do not. The winner, Mr. H. E. Furse, led up to his success by his admirable design which obtained him a first place in the Architectural School last year, and which we then published.

Though the other designs exhibited are not of very outstanding merit, one or two of them do indicate an appreciation of architectural qualities; but here again the perspective reveals an unhappy comparison with the elevations. The architectural designs in the upper and lower schools include some quite pleasing designs, especially in the Parish Hall subject, but we do not feel there is quite the spontaneity which gives generally some note of distinction. The first prize design for a parish hall, by Harold H. Coates, is nicely planned, with loggia entrances on the sides of the projecting flanking wings. The £20 prize goes to Douglas Jas. Fyffe for a memorial tower, which has some good monumental feeling, but suffers somewhat from an over-emphasis of parts which is a very common misfortune in such subjects.

There is some good work amongst the sculpture this year, and it is notable how well women keep to the fore in this difficult art, as one may judge by the charming draped figure of a woman by Winifred Turner, who secures the Landseer first prize.

Prize List.

Historical Painting.—"A Scene at an Inn." R.A. Gold Medal and Edward Stott Travelling Studentship (£200), Patrick Ferguson Millard.

Landscape Painting.—"Clouds Clearing after Rain," Turner Gold Medal and Scholarship (£50), Charles Knight.

Landscape Painting.—"A Scene in London." Creswick Prize (£25) and Silver Medal, Margaret Ida Euler.

Design in Monochrome for a Figure Picture.—"The Sacrifice of Noah," Armitage Prizes, first (not awarded); second prize (£10) and Bronze Medal, George Ernest Lambourn.

Design for the Decoration of a Portion of a Public Building.—Design with Figures for the Decoration of the Vault of a semi-circular apse in a Music Room, first Landseer Prize (not awarded); second Landseer Prize (£10) and Bronze Medal, George Ernest Lambourn.

Two Paintings of a Figure from the Life.—First Prize (£10) and Silver Medal, Eileen Robey; second Prize, Bronze Medal, Violet Evelyn Arnott.

Portrait Study of a Lady in Evening Dress showing Arms and Hands.—Arthur Hacker Prize (£30) and Silver Medal, Winifred Daniels.

Set of Four Drawings of a Figure from the Life and best finished Drawing of a Head in any Set.—First Prize (£10) and Silver Medal, Helen Mary Graham Wilson; second Prize (£5) and Bronze Medal, Thomas Hugo Morahan; Prize (£5), Charles Knight.

Drawing from the Antique.—Prize (£5) and Silver Medal, Thomas Hugo Morahan.

Composition in Sculpture.—"Jacob Wrestling with the Angel" (Genesis xxxii). R. A. Gold Medal and Edward Stott Travelling Studentship (£200), Eva Dorothy Allan.

Model of a Design.—"St. Michael overcoming Satan." First Landseer Prize (£30) and Silver Medal, Winifred Turner; second Landseer Prize (£10) and Bronze Medal, Ethelwyn Baker.

Two Models of Busts from the Life.—First Prize (£5) and Silver Medal, Winifred Turner.

Model from the Antique.—Prize (£5) and Silver Medal, Constance Stella Watson.

Design in Relief, containing Figure and Ornament.—"The Infant Bacchus": Model for a Wooden Decorative Panel. Prize (£10) and Silver Medal, Hubert Donald MacGeoch Gilbert.

Set of Three Models of a Figure from the Life.—First Landseer Prize (£30) and Silver Medal, Winifred Turner; second Landseer Prize (£20) and Bronze Medal, Una Rawnsley.

Design in Architecture.—"A County Hall." R. A. Gold Medal and Edward Stott Travelling Studentship (£200), Hubert Edwin Furse.

Set of Architectural Drawings.—"The Church of All Hallows, London Wall." First Prize (£10) and Silver Medal, Hugh Baldwinne Lyle Horner; second Prize, Bronze Medal, James Frederick Howes.

An Architectural Design.—Landseer Prize (£20) and Silver Medal, Douglas James Fyffe.

An Architectural Design.—First Prize (£10) and Silver Medal, Harold John Coates; second Prize (£5) and Bronze Medal, Sidney Norman Allen.

Landseer Scholarships in Painting and Sculpture, of £40 a year each, tenable for two years, have been awarded—in Painting to Charles Knight, Vsevolod Sozonoff, and William H. Cooper; in Sculpture to Hilda B. Ainscough.

STAINED GLASS

MR. JOHN A. KNOWLES, of York, recently read before the Scottish Ecclesiological Society, in St. Cuthbert's Hall, Edinburgh, a paper on Mediæval Stained Glass, with special reference to the conditions under which the craftsmen of the Middle Ages followed their callings. There was a common impression, he said, that when mediæval cathedrals were being built there were workshops nearby in which screens and altars were carved and gilded service books illuminated and stained-glass windows designed and painted. But it was quite mistaken, for when the fabric rolls or building accounts were examined not a single item of payment of wages for making any of these things could be found. They were made to order by tradesmen in the town. The absence of information concerning where the glass originally came from was explained: Glass making in mediæval times was a nomadic industry. The chief requirement of the glassworks was a plentiful supply of fuel close at hand. The furnace was only a small affair, so that as soon as all the timber within easy reach had been cut down for fuel, the glassworks moved elsewhere where more was to be had. We were very apt to imagine the mediæval craftsman as a man who did all the work himself, or with the aid of a son or an apprentice at most. But that is far from representing the facts of the case; sub-division of labour was the rule, and it was surprising to find into how many parts many trades were split up. We know that at St. Stephen's Chapel, Westminster, in 1351, six draughtsmen, twelve glass painters, and twenty or more glass-cutters and glaziers were at work.

INSTITUTION OF CIVIL ENGINEERS

Pioneer town planning and park-belt reservations in the laying-out of the principal towns and cities of Australia and New Zealand during the early years of the nineteenth century was the subject of an historic survey and illustrated discourse at the Institution of Civil Engineers on December 9 by Mr. Charles C. Reade, Government Town Planner of the Federated Malay States. Mr. Cecil Harmsworth (President of the Garden Cities and Town Planning Association) presided.

The lecturer (who was formerly Government Town Planner of South Australia, and responsible for the organisation of national conferences and passage of town planning and housing legislation in that State) said that both in New Zealand and South Australia extensive park-belts separating the existing town from the open country were laid down and reserved in most cases by instruction from those responsible for the creation of the reform schemes of settlement which originated in London from 1830 onwards. These park-belts originally were reserved for the purpose of public recreation. In the case of the New Zealand towns they were intended not to be built upon, but to remain a wide strip of open land between the central town and the open farmlands beyond. Suburban growths and town extensions of the past fifty years had long passed beyond the original town-belts, which, for the greater part, remained to-day an extraordinary asset and a valuable object lesson in providing means of recreation, pleasure and utility to the urban population of to-day.

Some years prior to the foundation of the first reform settlement in South Australia, between 1836-7, when Colonel Light planned the City of Adelaide, the advocates of the Wakefield system and other pioneers of colonisation reform devoted much time and attention to settling the details of town design. Plans for a model town in Australia, surrounded by a belt of parklands one mile wide and equipped with squares, open spaces, crescents, and other public reservations, were published in London in 1830—the year that witnessed the birth of Wakefield's first colonisation society which exerted such wide influence upon subsequent developments in Australia and New Zealand. It was an important circumstance, however, that although the instructions from London to the New Zealand surveyors in 1839-40 were very definite in respect to the provision of a belt of parklands between the proposed town and the open country, the instructions issued by the South Australian Commissioners from London to Colonel Light for the laying out of the first town in the new British Colony contained no direct reference to parklands. In other respects, however, the instructions relating to the town were similar in character to those given later to the New Zealand surveyors.

The lecturer showed by various examples that for fifty years prior to the foundation of Adelaide, however, there were considerable efforts at town planning in the Crown settlements of Sydney, Hobart and other towns in Van Diemen's Land (Tasmania). Numerous reserves for town sites, together with sites for public and ecclesiastical purposes had been made. Leading towns had been equipped with squares, crescents and park areas under the influence of British ideas and possibly earlier developments in the American colonies and other possessions. The laying down of important streets from 60 to 99 ft. in width in place of earlier standards based on 40 and 50 ft. had also been accomplished but with only partial success.

The lecturer, in conclusion, emphasised the need for outer and inner park systems in most modern towns. Financial and other provisions required consideration in formulating legislation for regional planning or the replanning of existing towns. In this respect he suggested that further attention and study could, with advantage, be given to the legislation and special assessment areas practised in Boston, Kansas City, Denver, and other American cities with such conspicuous success.

SOCIETIES AND INSTITUTIONS

SOUTH WALES INSTITUTE OF ARCHITECTS.

THERE was a large attendance of architects, students and their friends in the Assembly Hall of the Technical College, Cardiff, on December 3, on the occasion of the annual prize distribution and exhibition of students' work in connection with the Department of Architecture and Civic Design, Technical College, Cardiff. Mr. T. Alwyn Lloyd, F.R.I.B.A., presided, and the prizes were distributed by Mr. C. F. Ward, F.R.I.B.A., President of the South Wales Institute of Architects. Mr. W. S. Purchon, M.A., A.R.I.B.A., Head of the Department, gave a brief address on the growth of the School of Architecture since its establishment about five and a half years ago. During the evening comments were made on the high standard of work which had been reached by the students, as shown by the work on exhibition, as well as on the increased accommodation and other facilities which will shortly be available for the Department of Architecture. Votes of thanks to Mr. Ward and the Chairman were proposed by Captain Anthony, Registrar of the University of Wales, and seconded by Councillor Rhoda Parker.

The prizes were awarded as follows:—

Department of Architecture and Civic Design Prizes, Certificates, and Diplomas.

President's Prize for Draughtsmanship, £3 3s. (presented by Mr. C. F. Ward, F.R.I.B.A.), J. B. Wride.

The First Year Prize, £2 2s. (presented by Mr. Percy Thomas, F.R.I.B.A.), C. J. Bartlett. Second Prize (presented by Head of Department of Architecture and Civic Design), Miss O. E. Price.

The First Year Prize for Part-time Students, £2 2s. (presented by Mr. T. Alwyn Lloyd, F.R.I.B.A.), G. L. Price.

The Working Drawings Prize, £2 2s. (presented by Mr. Ivor Jones, A.R.I.B.A.), L. Monroe.

The Architectural Sketching Prize, £2 2s. (presented by Mr. H. Feather, F.R.I.B.A.), P. G. Budgen.

The Essay Prize, £2 2s. (presented by the Architectural Press, Ltd.), Llewelyn ap Gwynn.

The Sketch Design Prize, £2 2s. (presented by Mr. H. Budgen, F.R.I.B.A.), L. Monroe.

The Village Improvement Prize, £2 2s. (presented by Mr. Clough Williams Ellis), J. B. Wride.

Certificates in Architecture (carrying with it exemption from the R.I.B.A. Intermediate Examination), H. Bull.

Diploma in Architecture (carrying with it, under special regulations, exemption from the R.I.B.A. Final Examination, with the exception of the subject Professional Practice), B. W. R. Thomas.

The South Wales Institute of Architects, Central (Cardiff) Branch Prizes.

Design, 5th Year, £3 3s., B. W. R. Thomas; 4th Year, £3 3s., J. B. Wride; 2nd Year, £3 3s., P. G. Budgen; Atelier, £5 5s., E. Tyler. Measured Drawings Prize, £ 5s., J. B. Wride.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

Formation of Design Club at Exeter.

A MEETING to inaugurate an Architectural Design Club for Exeter and district was held at the University College, Exeter, on Tuesday, December 8. The chair was taken by Mr. E. F. Hooper, in the unavoidable absence of the President of the Society, Mr. J. Leighton Fouracre, and in addition to a large attendance of architects and students, there were also present the Chairman and Secretary of the Exeter City Education Committee, Alderman John Stocker and Mr. A. C. Badcoe, and the Registrar of Exeter University College, Mr. A. K. Woodbridge. After formal business, the Chairman welcomed Mr. Howard Robertson, Principal of the Architectural Association School, and Mr. F. R. Yerbury, Secretary of the Association, and thanked the Council of the Architectural Association for their keen interest and great assistance in the formation of the Club. He explained the serious need of facilities for architectural education in Exeter and district, and that, following the remarks in the President's address on this matter at the annual meeting held in March last, a small committee was formed to suggest lines on which suitable action might be taken. With the approval of the Council of the Society, the Architectural Association were approached. They suggested that subjects should be set in accordance with the A.A. School programmes, and offered the

assistance of their masters, who would visit Exeter periodically to advise students and criticise their work.

Mr. F. R. Yerbury conveyed the good wishes of his Council, and said they were very willing to give every assistance in the formation of the Club. The Architectural Association was originally formed in very much the same manner, and in more recent times the Bristol School of Architecture had been established with the help of the Architectural Association, on lines very similar to those proposed for Exeter.

Mr. Howard Robertson described in detail the scheme of training practised in the Architectural Association Schools, explaining how this could be adapted to the requirements of the Exeter students. A collection of students' drawings which he had brought, and which were arranged around the walls, were used by him to illustrate the progress of a student passing through the various years of the school study. He impressed upon the students the necessity of hard work and study, to obtain that flexibility of mind which was essential to the needs of architectural practice. Design must be the logical outcome of the practical requirements of each individual problem, and whilst guidance was given in the various architectural styles, this was always felt to be subsidiary, and assistance would be given on any style which the student might select. Passing to the subject of construction he felt sure that, whilst this was given important consideration in the Architectural Association School programme, here in Exeter the matter might be left with the local architects to whom students were articulated, and to the course in Building Construction established at the College. He joined with Mr. Yerbury in wishing the new venture every success.

The scheme for the working arrangements of the Club was then briefly outlined by Mr. W. J. M. Thomasson, who has been asked by the Committee to act as visiting architect for the first few evenings. After this, Exeter architects will undertake the duty in turn, it being recognised that the guidance so given will in no way interfere with the programme, set by the Architectural Association from London.

Mr. Percy Morris proposed a hearty vote of thanks to Mr. Yerbury and Mr. Robertson for their assistance.

ROYAL ARCHÆOLOGICAL INSTITUTE.

A lecture on the "Sculpture of Monumental Effigies in England during the Middle Ages" was given recently at the Royal Archæological Institute by Mr. J. G. Mann, B.A., B.Litt., F.S.A., who said that until recent years effigies had not received the same attention that had been accorded to the other contemporary and allied form of memorial, the monumental brass. The former had suffered terribly in the past from neglect, wilful destruction and nineteenth-century "restoration." Of the survivors to-day alabasters had probably suffered least. The freestone and wooden figures had lost their original coatings of gesso colour, and were only the core of what they once were. English effigies had suffered little from deliberate destruction compared with those of France, where the Revolution did great damage. In Germany they tended more to execute carving in relief instead of the round; Spain has many wonderful alabasters, though of late date. No effigies were made in this country earlier than the twelfth century. At first our craftsmen were clearly affected by the French figure sculpture such as Chartres and Amiens. They produced the stone figures on the west front of Wells Cathedral, and these inspired the origination of a south-west school of sculpture. King Henry III's quarries at Corfe gave the material for the Purbeck marble effigies which were to be found all over the country, dating throughout the thirteenth century. The lecturer stated that the subject was divided into three chronological divisions which greatly overlapped: (a) Purbeck marble effigies in the thirteenth century; (b) freestone in the thirteenth and

fourteenth centuries; and (c) alabaster from 1350 onwards. By 1400 alabaster completely predominated; the material lent itself to elaborate and delicate work, such as the reproduction of details of costumes and heraldry. A marked change in style took place after the Black Death, corresponding to the architectural change from the Decorated to the Perpendicular style. Geologically England fell into four departments of effigy sculpture, whose styles were greatly affected by the material used. During the freestone period there was a northern school, of which York was the centre, which produced robust figures carved in magnesium limestone. A south-western school carved delicate figures in oolite from Ham Hill and Doulting. The centres of these areas were Wells, Bristol and Exeter. As the beds of the stone used were so shallow, projections had to be kept within their limits, and thus gave slender and restrained figures. The south-west Midland school, using the local soft sandstone, developed a looser, less detailed style. The fourth, the London school, using oolite from the surrounding districts, was the most important. Its influence in good, clear carving extended far afield, and subsequently dominated the alabaster of Nottingham and Derby. This latter was mainly shop work; figures were copied almost identically and transported everywhere by land and water. They were of great finish and richness, even if not of inspired art; the proportions were excellent, and the figure carved in a strong rounded style.

The lecture was illustrated by a series of slides lent by Mr. F. H. Crossley, of Chester.

THE MUSEUM-PALACE OF FRANCE

The Louvre and the Tuileries, Paris.

A recent lecture by Sir Banister Fletcher at the Central School of Arts and Crafts dealt in detail with the Palais du Louvre, on the banks of the Seine, and the ill-fated sister palace of the Tuileries, to which it was once connected. Beginning with a description of the small chateau which stood on the site in the Mediæval period, Sir Banister compared it in those early days with the Tower of London, and then proceeded to describe the gradual building and rebuilding of the romantic palace of Renaissance times, including the buildings round the square Cour du Louvre, and those further westward flanking the Place Louis Napoleon, and the wings along the Quai du Louvre and Rue de Rivoli, leading up to where the Tuileries stood, that project of Catherine de Medici which ultimately perished. The atmosphere of this palace and its Museum and Art Galleries were well presented.

London Ice Rink.

Work has been started on the construction of an ice rink for London on a site near the Houses of Parliament. London will probably have the most complete and up-to-date skating rink in existence when the building is opened next October.

Replanning London.

Commenting in *The Times* on a letter by Mr. Thomas Adams, Professor Adshead writes:—"Before any wide planning of London is undertaken, the question of finance must be seriously dealt with. No funds are at present directly available for sterilising or securing open spaces of wide interest to Londoners. No funds are directly available for assisting in their early struggles in development new outer suburbs or satellite towns. It would seem that powers for imposing contributory rates over wide areas should be given to the county authorities, to the London County Council, or to some properly constituted statutory body, and power to raise loans on the security of betterment that by judicious town-planning will eventually accrue. Until some such financial powers are granted, the planning of London will be half-hearted and anæmic, and every bold suggestion will be entirely dependent upon issues too uncertain to be of any worth."

PHILIP WEBB AND HIS WORK—XII

By W. R. LETHBRIDGE.

CAXTONS AND WHITE HORSE HILL.

Through the intervention of Mr. S. C. Cockerell it was arranged that Mr. Wilfrid Blunt would let Webb a pleasant little old house, Caxtons in the parish of Worth, Sussex, about half a mile from the Saxon church and a mile from Three Bridges station. Mrs. Wickham Flower, the former mistress of Tangley Manor, found him an excellent house-keeper—Mrs. Dickinson—who took good care of him to the end. During the autumn, 1900, he had the cottage (rent £15) repaired as if for the Anti-Scrape, and moved into it on January 4, 1901.

Something more than a cottage in origin, probably a small yeoman's house, it was by the wayside, built of brick with some timber posts and beams. A good hall-like kitchen in the middle, which had windows both back and front, became the living room. At one end was the working kitchen with a brick oven, and at the other a little room where he put up

Years before he had spoken to a friend of mine of how hard it would be for anyone to retire without a hobby, and in his diaries of this time is evidence of his having kept himself in hand by regular drill of working and walking: "I have become a hewer of wood and drawer of water."

"Flocks of 1,000 or 1,500 sheep at a time make the only crowds I look on, and these baaing ones are wending from Sussex winter pasturing to the plains of Romney Marsh."

Mrs. Dickinson tells me some memories of this time and place:

"The well at Caxtons was very deep. You could hardly see the water; it took one hundred and ten windings to pull up the bucket. Mr. Webb used to do fifty and I would do fifty, and he the last ten. Then we helped to carry the bucket to a tank and empty it. He would have a cord of wood from the forest and sort it out—birch, ash, oak—and would saw it up in lots, dating each as it was done.

FIG. 1.—BOOK PLATE.

bookshelves. At the back of the cottage lay a vegetable garden and small orchard. Close in was the well—"74 deep" he noted. In front was a little strip of garden where he grew a few favourite flowers, one being the wild yellow tulip.*

The whole thing was exactly like Webb, and here he settled down to a habit of what his diaries call "doing the necessary things," chopping wood, drawing water, taking long walks, making friends with neighbours in and out of society, doing some residuum of "invention" and welcoming his friends. Miss Morris writes: "He never lost his sympathy with country life and came back to it simply and easily in his latter days." Then of visits to the Worth cottage, she adds:

"You know how he would come to the station to meet one—the pleasant walk up—perhaps a stroll later into the forest, and a talk about the Arab horses—the beautiful hospitality, the sweet homeliness of the spread table, the touching insistence that one should eat heartily of some simple dainty. Then the chairs drawn up in his own inner room, and the long talks."

"He would stand for hours at the backdoor with his gun watching rats, and I don't remember him ever missing one; then he would bring it back by its tail and tell the age of the rat. The apples and quinces were picked one by one, just twisted to find which would come off the bough easily and were ready to pick.

"He helped the children with their lessons and taught them the names of flowers and birds, showing them the pictures in his Bewick. He used to pinch my boy's cheek, saying he was like Oliver Twist—'see the oiliness of him.' He showed him how to draw, and the sheep is one of the drawings [enclosed] he made; the others he gave him to practice from. Sometimes he would ask for a sultana pudding, and say to the boy: 'We will have Benjamin's share.' Then he told the children that Philip means lover of horses, and Webb originated from web, weave and webber. He used to say: 'When you can see a cluster of stars so that you could not put a pin between them you may know you are going to have fine weather!'

"The only time Mr. Webb was ever at a wedding was once when he was looking over a church—I think he said it was Iffley—and the sexton shut the door while the wedding was going on. He used to say he would not have been there then if he could have got out.

"Children would come for the daffodils out

of Mr. Webb's field, and ask for enough for wreath for someone's grave. He used to tell them to pick a dozen and come back and show them to him. Tommy Vallance, the little crippled boy, always told him when he wanted new boots or a new hat, and he used to send him to Peter Brown's and have the things put down to his account, saying: 'Mind, the best he has got.' The carol singers came every year, and he would let them sing for some time. Then he would open the door, saying 'Stop! That's not proper singing.' And he would beat time and sing, making them follow, then give them cake and money."

To A. H. P. [January (?) 1901]: "It is good of you to give me a turn of your hand into my new resting-place, though that is hardly true in these early days of it—for I am 'at it pretty well all day long; either drawing water, cutting wood, blindly searching boxes for things which are seldom found, and running for provisions of various small orders to bakers, grocers, ironmongers, &c., and more than &c., again. For which labours of love 6.30 a.m. rising, the one gain on the day; and now that 6 ft. of snow has fallen 'shank's mare' finds it hard going on the roads. Sometimes I am more cheerful with surroundings such as have been long searched for in the spirit, and have not found in the flesh with just that dash of inequality in their value to make the drama a really imperfect one, giving room for the goal of hope to exercise its calling and beckoning to something other—somewhere. In spite of it being the wrong season for transporting the living soul and dissatisfied body, still the place and its surroundings clearly say—'patience; you will find me very good if you too are good. The scramble has been immense for an old man single-handed; and in spite of my churlish, unsocial nature, I feel the withdrawal from many—yes, many—very real and beloved friends. . . . The chatter of [Mrs. Dickinson's] two children does not annoy me even when the door to the kitchen between this 'keeping room' is open three parts of the day. It is a little more than the ticking of the clock to me. . . . You will note the scrambling hand-writing of this—my hands are sore from labour. . . ."

To S. B., June 25, 1901: ". . . This is a pleasant place, and in most ways very fitting for my need; also it is in its way singularly beautiful, though not quite in the way the more postical district of the Cotswolds appeals to me. . . . My time is more fully occupied than when I was 'professional,' and a 37 year tenant of a flat—message in Gray's Inn, and the muscles (below my brain pan) are very much exercised. S. C. drops in now and again on Saturday afternoons to prove the growth of the dry stick he has planted in Sussex, and looks keenly for some sign of sprouting. Walker and he gave me a bit of drawing to do, but I can only set hand to it on Sundays when the axe, the saw, the spade, shovel, fork, &c., are stabled away and my hand has a chance of not being too shaky. My little front garden between the cottage and the road was trampled to billiard table hardness by the Sussex brick layers, nicknamed 'the Slouches' by me. The working folk about here much run in tribes of names as Dench, Luker, Budgen, &c., but the largest of all the tribes is that of the 'Slouches,' who are mostly bricklayers, and a happy-go-lucky lot they are. Now the Carpenters are fairly ingenious, as are most of the farmers, forest woodmen and others. But, of the little garden—It having been let alone in a masterly way till it could declare itself in Spring time, has itself upsprung, and is gay with pretty, pleasantly smiling and delightful flowers. The orchard at the back is a perfect jungle broken through with apple, pear, plum and quince trees. The whole place has been neglected. . . . All this has to be mended by me single-handed, including the making of paths, and the growing of the smaller edible garden stuff. I never knew how small a way a pair of hands could make in the multitude of ways a neglected place calls—I may say, yellow. I like the work, which does me good, and do not feel inclined to risk employing other hands. This, you see, is all about myself. Now you must fall to and tell me of yourselves

* Mr. Aymer Vallance notes how fond Morris was of the tulip *Sylvestris*, and wonders whether he gathered it into his patterns directly or through Persia. The answer is, direct.

like fashion; and do not spare me anymore in yours, very truly, Philip Webb, has spared

The piece of drawing referred to was a book plate, for which a peacock was desired. For he produced a miracle of a drawing, all the so as the work of a man of seventy—a miracle of a miracle. The original drawing is only a trifle bigger than the reproduction given (Fig. 1).

On August 28, 1901, he wrote: "This is the first time for many years I've had the opportunity of watching the sequence of the seasons in the country. It interests me much. It is fortunate that the humble cottage for your content is not yet findable in the Cotswolds: my mind for a whole year or more was set on finding there myself. . . . My only drawback is being too near London, and that there are more 'carriage folk' than suits my inclination."

To A. H. P., October 21, 1901: "Truly I ought so well of your wood-engraving that I set myself to wishing you might master the petty craft and lift it out of its submerged condition; you will, of course, guess that I should know pretty well what patient practice should be involved in getting mastery. I tried once and found it foreign to my aptitude. . . . 'Shank's mare' always attracted me, especially when looking at gipsies, male and female, riding along as if they were Greek gods from the Archipelago—none of your mincing Misses Mashers, but like the immortal Isopel of the 'big house' of Long Melford. The Cockerell looked in upon me last Friday, to lighten me out, and knocked a year off my life. His 'firm' [Walker & Cockerell] promises more work, and I promise to try to do it gently and to order with the hope of getting the money to pay part of the cost of a work-

shed I am going to put up where a wet day can be better spent in needful jobbing than without it. Am really in excellent health with some chronic rheumatism, the trifling reminder of my rheumatic fever time of 1889. I have it mostly in my arms which a bit of wood clearing relieves for a while. You will not forget to hand on my friendliest remembrance to the good Pinbury folk, men, women and children."

To A. H. P., March 7, 1902: ". . . The good-natured J. R. Holliday, of Birmingham, was weak enough to wish me to undertake designing a mace for the new University of Birmingham. I gave in being a real democrat. . . . well this is occupying much of my too little time now that the spring calls for attention in garden and orchard. . . . That old and pleasantly monotonous singing at the plough stilt—how well I remember it sixty years ago in Berks and Oxon, two counties late and laggard in moving out of the furrows of life. I hope you may have caught the lilt of the old-world tune to bring it back for me. . . . I've looked at Oakridge [Gloucestershire], on the 1 in. Ord., and find your sunny side of the wold. If I had got to that little message of Tunley, the neighbourhood would have been pleasant; but I'm here where aristocrats and their imitators much abound, along with 'bags' of 14 hundred! pheasants at a day's murder. . . . Oh! those stone mullioned houses—so like enchantment to this poor penman of Oxon and Berks! My work-shed is up, and already rather crowded, but 'tis undoubtedly useful: for though I am slow it already saves me half the time in doing the various and constant tinkering here. The S.A.[frican] muddle and godless gamble both wearies and pains me, so good-night, my friend, for I've had a tiring out o' door day, and I've three days (of five hours) a week at the sorrow-dealing mace. Walker looked in on me on Saturday and kept me in touch with the greater world than Worth."

"The sorrow-dealing mace" was one of silver—presented by Mrs. Beale, of Birmingham, to the University, which, through Mr. J. R. Holliday, he had been asked to get made. The first drawing, as delicate in its way as the bookplate, was finished on January 10, 1902, and the final full-sized details were ready in April. It was made by Mr. Catterton Smith with so much sympathy of interpretation that there is not the usual hiatus between "design" and doing. (Figs. 2 and 3.)

To Mr. J. R. Holliday, June 11, 1902: ". . . Of course in less decadent times of the decorative arts, such elaboration of drawings would have been unthought of, as the silversmiths would have designed the work themselves and carried it out with the unbroken growth of their tradition and habit."

To Mr. J. R. Holliday, August 31, 1902, about a projected book-plate: ". . . 'Cannot you think of something in your life or belongings or fancy or fact which would be a hook on which to hang my 'fancy'? I do not like to make such a design which has not some sufficient significance. When I have this it tethers me to some positive course. . . . There is always a load on my spirit of things undone

when undoing to get into bed 365 nights in the year."

During this year Sir Lowthian Bell, now an old man, wrote to Webb: ". . . 'The longer I live here the more I feel indebted to you. . . . I do not like to think that we have never to meet again now that I am in my eighty-seventh year. . . . I have a request to prefer that you would let me hang on my walls a specimen of your drawing. The price of course I leave to you. . . . Would you kindly inform me the usual practice among architects. As an example, I will take this house. After the plans were agreed on a clerk of works was appointed and you visited the scene from time to time. Did you make any charge for this in the way of travelling expenses and time? If so, what were the amounts? . . .'" To the last point Webb replied that "it was the custom in my time to charge for travelling but not for supervision."

Philip Webb to Sidney Barnsley, July 11, 1902: ". . . 'Time goes faster than a 'motor,' but happily without the noise and stink. Also, I've had a piece of designing to do which occupied more than my spare time for three months or so—not professional, for I resist that as belonging to the building colts coming on. Again, 'Antiserape' gives me work. . . The break-up of your combined homesteading rather touches one, for I had got hold of the place in my mind. Naturally, your account brought out my maps of the Pinbury district. The new situation easily recognised by my remembrance of the tumbled ground just N.W. of the churchyard, where a former house had stood; when lodging at Mr. 'Dick's' there was repeated strolling there. I also remember—which I looked at with sighs over such pleasant ground being disturbed by a bigish house for swell-domania. The work to be done is a point of gratification. The following is, I believe, not in the Prayer Book: 'From being without work to do, good Lord deliver us.' I much like the thought of Daneway being turned to such

THE TOWN-PLANNING INSTITUTE

inoffensive account, and the rats banished by cats and industry. . . ."

To A. H. P., August 29, 1902: "The cloud formation here has been heavenly; magnificent, as if just came direct from the Gulf of California with samples of those over Martinique. Never saw such inspiring clouds. The sun going down with fiery dogs on his haunches while in the N.W. a monstrous range of cumulous Dolomite, in stationary forms for half-an-hour on end. Why should I grumble that Tunley [in the Cotswolds] is not my native heath?"

In the diary for the year 1902 is noted: "Cutting dead wood out of fruit trees; Geo. Dench finishing plaster floor of shed; emptied the dung pit; at work on full-size of Birmingham mace; the two children vaccinated; sheared the privet hedge; got the children's garden patches ready; did tinkering, carpentering, puttying, &c. Saw the first swift of the year (May 18); W. S. B[lunt] here with Lady Windsor; to the forest to see the upland mere; Percy Wyndham [of Clouds] and Reginald Yorke [of Forthampton] here; Proctor here [of British Museum]; Lady Mayo here; Mrs. Morris here."

This year a pair of cottages, stout and trim, were built by Mrs. Morris at Kelmescott, as a memorial to her husband. Mr. Jack looked after the building of them and carved a delightful relief panel of Morris looking up at a tree full of birds, from a sketch by Webb—it was suggested by Morris's words, 'the town of the tree.'

Towards the end of 1902 he offered his Kelmescott Press books to Trinity College, Cambridge, and on their acceptance he wrote to the Librarian on December 15, 1902: "All Morris's work was based on an extraordinarily wide knowledge of the rise, decay and fall of the arts; this he was able to assimilate as a foundation for his work, and proceed with real originality; thus avoiding the fatal step of imitation. Making this gift could be from no generosity on my part, for, having been seeking for a long time a safe and congenial home for the books, helped as I have been by quite competent friends, I now feel at rest; I am therefore merely a transmitter to posterity of works too valuable, either to be sold for a profit, or locked from the attention of students in the arts."

In the winter of 1902 Philip Webb had a severe illness. Later Mr. Hale White referred in a letter to "that terrible wave of infected air which caught you when you were gathering fruit years ago." For a long while he had to lie in his bedroom, which was ceiled slanting to the ridge: "This is a perfect bedroom" (he wrote to S. C. C.), "like a tent, and nothing ugly in it. The sun came in so beautifully this afternoon. By the way, here is a note for an architect if there is ever another. Always keep the windows on the south side low, then you can get plenty of sunshine without too much heat and glare. The windows on the other side can be high."

On January 21, 1903, he wrote: ". . . Dreadfully disinclined to commit myself to paper, pain and dozing stolidly reigning supreme in the small back room. The rheumatic-lumbago is an adventurous friend who means to stick till March, I believe." "Stick" it did much longer, and from this time he did very little drawing.

To W. R. L. (1904): "Of South Italian things [the earthquakes], they are too terribly saddening to say more than—the gods are good to let us know we are what and where we are. At this moment in peaceful Sussex 'the Heavens are telling' with great and beautiful and terrible storm clouds with Paradise shining in between the stratification of them. . . . The Cockerell was here with but three-quarters of an hour's whisk of his tail. . . . I would that I might sit up and do some kind of inventions ["designing" crossed out], but my wits are no more trustworthy than the back."

December 5, 1904: "I thought the new things seen the other day in London incumbrances of the ground; they take the heart out of one."

December 21, 1904: "The *Memorials* [of Burne-Jones] is a real story and the letters in it master-work of wit and wisdom."

(To be continued.)

PROFESSOR PATRICK ABERCROMBIE (President) took the chair on Friday last at the rooms of the Institution of County and Borough Municipal Engineers at an ordinary meeting of the Institute, when Mr. I. G. Gibbon (Ministry of Health) read a paper on "The Town Planning of Built Areas."

Mr. Gibbon opened with a criticism of the use by town planners of such phrases as "built-up" and "lay-out," and said that for that night he intended to depose "built-up" and substitute "built," which adequately expressed their meaning. Much had been said and written by those interested in town planning of the necessity for this new power of planning built areas; but singularly little had been contributed in this country to hard thinking on the problems connected with it. They at the Ministry of Health had at times been criticised because they had hitherto refused to allow built areas to be included in town planning, except within narrow limits, especially by those who, not being lawyers, suffered from the amiable infirmity of being sure of what the law was. Having to administer the law, he preferred to take the advice of those whose business it was to interpret it. While, however, they had been strict in observing the limits of the law, and they would be justly open to stern rebuke had they done otherwise, they had in fact been devoting a great deal of attention to the planning of built areas. He was not going to put before them any cut and dried scheme, not because there was none, but because he was genuinely anxious that there should be an independent contribution from outside official circles. In some respects the problem of planning built areas was simpler than that of planning undeveloped land. All town planning had an element of prophecy; that was one of its chief difficulties—and perhaps one of its principal attractions for the unwary. But there was, at any rate, this advantage in dealing with built areas, that development had already taken place, that there were, therefore, very definite facts on which to build a future scheme; further that there would probably be many instances of re-development which would serve as safe pointers to the directions which re-planning should take. These pointers were likely to be far more numerous than in any large undeveloped area. Here they were met with another question—what should be the aim of the re-planning? They knew there were a good many ideas in the air—the decentralisation of industry, open development and the like. How far were these notions, even the tested ones, to be applied to proposals for the re-development of their towns? He suggested that it was of the greatest importance that it should be firmly realised that town planning was a hard-headed business proposition, that its success depended on the strict observance of this fact, and that failure to do so would but discredit and retard the whole movement. That did not mean that considerations of amenity and of beauty and the like were hustled off the map. These had their place, and to neglect them might be the very way to be unbusinesslike, but it did mean that they had to stand the test of hard fact, that they had to be accommodated to practical necessities, which, indeed, usually was the one means of securing the best even of beauty, and that, strive as hard as they might for new Jerusalems, they were not to be gained in a day, and those which might seem easy of achievement were generally by bric-a-brac.

A number of problems arose because of the costliness of the property to be controlled by town planning in built, as compared with unbuilt areas. In zoning, for instance, the setting aside of particular land for industrial or other business purposes may much increase its value. But the reservation of land for general residential purposes (not for particular classes) was not likely to make much difference to value in undeveloped areas. The position

might, however, be very different in built areas, especially in the inner cores of towns and cases would readily come to mind where the reservation of some areas for business purposes and of others for residential might result in a large transfer of values. There was compensation in respect of zoning certificates reasonable, and it therefore behoved those who were planning built areas to be careful that they did not do injustice to private interests. It might well be that, for this reason, proposals might in some cases have to be accepted which were less than were desirable for the general benefit of the district, though, if the benefit be very great, it should always be considered whether it was not worth purchasing some compensation to the interests which would otherwise be unreasonably injured.

The high value of property would be acutely in connection with proposals in town planning schemes for improvements in communications. It might be contended that the right course was to provide that compensation shall not be payable except when the owner of the property wished to do something (re-erect or alter his building, for instance) which would require observance of the new building line or the Local Authority required him to back the building—that was, when there was some actual restraint of action, on the face of it a not unreasonable suggestion. Some would urge, however, that this was not fair to the owner, that the value of the property was reduced, or rather might be reduced, for this was not by any means always any substantial reduction, and that, if he had to sell the property with the restriction, he would get less for it. On the other hand, it had to be remembered that, in a case of this kind, when he would be selling would not be merely the property, but also the right to compensation if at any time the building had to be set back and it might be argued that there would be any reduction, or very little.

If, however, compensation was payable immediately the restriction was fixed, and if long time elapsed before the restriction became effective, the general community might be unfairly mulcted, and, what was of equal importance, a general reluctance might arise to providing ahead for necessary improvements, and at the time and in the way which was likely to be of most advantage to the common good. Such was the problem. It was out that night to set problems, in order to stimulate independent thought on them, and to propound his own solutions.

Hitherto, in the planning of unbuilt areas the experience was that claims for compensation were not heavy, especially if, before plans were definitely formulated, particularly before anything was made public, there was friendly consultation with owners, and their wishes were met so far as was consistent with the public interests. The position, however, might be very different with the planning of built areas. Under town planning the position should be much better than with street improvements, because proposals could be looked at as a whole, and more systematic measures taken to increase property values in the improved areas, and larger sums be raised in partial recoupment. Even then, however, the cost of improvements might be heavy (though the savings in transit, business, convenience and health had to be placed on the other side) and it became a crucial question whence the money was to come. One source of means was from increased values. They were not always easy to prove, even though it be clear that they were there and, hitherto, their importance had been chiefly as an offset in preventing possible claims for compensation. When they came to deal with built areas it was to be expected that increased values would be more important and provide a larger contribution, but present indications made it doubtful how far they were likely to prove a highly fruitful source. The Local Authority

as now enabled to claim only one-half the increased values. It was a good device to leave the share to the private owner, thus removing any sense of grievance and stimulating initiative. It might well be considered, however, whether it was necessary to restrict the share of the Local Authority to as low a figure as one-half, when it was remembered that the only increment of which the Local Authority could claim a share is that shown to be due to their scheme. A practice much adopted in the United States, and growing in favour, was to assess part, or even the whole, of the cost of a public improvement on property which was considered to benefit from it. They had the same principle in their law, notably as regarded private streets, but had applied it but timorously.

The fact that so much of the property in built-up areas was owned in small lots would make more difficult the carrying out of re-development on the best lines. These and other difficulties had inclined some to the conclusion that the only way to be sure of securing the re-planning of their towns to the best advantage was by the ownership of the land by the local authority, a facile suggestion beset with many difficulties. Undoubtedly this measure would ease the situation materially, and it was significant that in recent years there had been a marked growth of feeling in municipal circles in favour of ampler powers, and more use of them, for the acquisition of land, evidenced, for example, by the powers for the general acquisition of land which had been obtained by many towns. Here, again, it was scarcely necessary to point out the magnitude of the proposed solution and the difficulties involved—the huge cost; the problem of municipal management; the political possibilities if, in most, of the land in a town were municipally owned, and the repercussions on municipal life. Alarmed at the cost of complete acquisition, some had suggested that the right of reversion alone, after a period of years, should be acquired, the immediate cost of which might be relatively small. But this would not benefit the present generation; further, though small now, the total sum paid, with compound interest, would, of course, be large; and intermediate developments, and many such would probably be needed, would have to be paid for in full. In Germany the difficulty which had arisen in re-planning because of small, or of inconvenient plots, has been met to some extent by giving the local authority a power (*Lex Adickes*) to pool land and to redistribute it according to the several interests, and a somewhat similar power, but much more limited, could be exercised under our own town-planning law, and had been incorporated in the model clauses (clause 42). There was another line of possible advance which it would be well to explore and to discuss, one scarcely touched in this country—whether, in some of these cases, at any rate, it might not be possible, compulsorily if need be, and the public interests so demand, to pool all the land in what might be termed public utility trusts, continuing under private management and with all the owners having holdings corresponding with the values of their property.

The speaker next touched on what in the United States are termed "blighted districts," i.e., residential districts where the property has deteriorated but which cannot be called slum areas. Manifestly, the town planner of built-up areas should pay particular attention to such districts, for they presented special problems of their own, afforded manifest opportunities for obtaining improved social values, and provided chances of convincing even the most sceptical of the gains which were to be won by systematic planning.

It had been suggested to him by persons of experience that provision might well be made in town-planning schemes by which periods of assured life should be given to different parts of a town, according to the condition of the buildings in them. Thus assuming that the general state of the buildings in an area,

which might be big or small, made it clear that they were not likely to have an effective life of more than twenty-five years, that period would be fixed. Any restrictions imposed by the town-planning scheme would come into full effect only at the end of that period, but until then would not be operated, except that compensation would not be payable in respect of anything done by owners of property in the meantime, unless with express permission, which would render the town-planning proposals more costly to execute. The town-planning authority would not be debarred from carrying out improvements during the intervening time; but, if they did so, they would be liable to pay full compensation, even in respect of matters, such as restrictions on the character of buildings, which would not be subjects of compensation after the expiration of life period. The proposal was a new one, had many apparent attractions, but also was hedged with many difficulties.

The success of zoning in the United States, particularly in New York, should alone be sufficient, in large measure, at any rate, to remove doubts from the minds of practical men. But, while welcoming this confirmation of well-founded hopes, it was essential that they should think out their problems on their own lines and secure solutions adapted to their own conditions, at the same time making full use of the valuable experience which was available to them.

What he was anxious to secure was that, when legislation came, there should have been a thorough investigation of the problems which would arise in order that town planners might be fully prepared. It was a British habit to jump into the sea and learn to swim when in a habit, while not wholly without advantages, was not one much to be encouraged. They would find, in a subject so complicated, plenty of difficulties which could not be foreseen; there was, therefore, the most reason why they should endeavour to master beforehand those which were already manifest.

Considerable discussion followed the reading of the paper, the speakers being the President, Mr. Raymond Unwin, Mr. Lovelock, Mr. C. C. Reade, Mr. Greenwood, Mr. Platt, and Mr. Marsden.

Mr. Unwin suggested that a special committee of the institute should be appointed to consider the whole subject of the planning of built areas and report.

The president promised that the matter should have the consideration of the council.

Mr. Greenwood (city engineer, Chester) pointed out the difficulty the city was in with regard to its town-planning scheme. With the object of preserving its historical and archaeological possessions the whole area of the city would be included in the scheme, but there was a prospect of the built-up areas being left out in the final stage owing to the heavy cost involved in re-planning. He suggested that public notice should be sufficient for all stages.

Mr. Gibbon agreed that the present position was not satisfactory. He saw no reason why public notice should not be sufficient, if backed on to that it was provided that if an owner chose to register himself with the local authority he should receive individual notice. It was for the Institute to persuade the public of the necessity of such changes.

The Cape Institute of Architects.

We have received the Year Book and Journal of Proceedings of the Cape Institute of Architects. We see that Mr. John Perry is now President and Mr. C. P. Walgate, A.R.I.B.A., A.R.C.A., Vice-President. The financial statement shows that the Institute has been run on a loss of over £200 during the last year. This is accounted for by the cost of maintaining the Cape School of Architecture, a responsibility which has now been assumed by the Cape University. The number of members of the Institute is continually increasing.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

Hard Tennis Court.

[REPLY TO W. DRAKE, DECEMBER 4.]

SIR,—Your correspondent's suggestion of 3 in. concrete and $\frac{3}{4}$ in. granolithic would be expensive, the surface unyielding, and it would have to be laid to falls for drainage; in addition, there is the risk of cracks developing. May I draw your attention to the porous type of hard court, the surface of which is made of crushed brick (with particles of dust removed) combined with a special preparation of cement? Such a court has recently been laid in the Royal Botanic Gardens, Regent's Park, and has given complete satisfaction.

H. G. M.

Building Line.

SIR,—I am preparing plans for a house to be erected in a district where the local authority is a rural district council. I believe that in a district which is governed by an urban district council, the authority may compel the owner to erect the new house to "the line of building on either side." I should be glad to be informed whether a rural district council has the same power, as I find it impossible to erect the house to the same front line as other houses in the road.

ENROBSO.

Damp-proofing Walls.

SIR,—Rain percolates through the bricks of a block of houses built in an exposed position. Can any reader inform us of the best treatment for the external surface of such walls to render the bricks impervious to moisture?

INQUIRER.

Penalty Question.

[REPLY TO "P. W. G.," DECEMBER 11.]

SIR,—A penalty is a sum of money payable as compensation.

The penalty clause in a building contract usually fixes penalties or liquidated damages payable, or to be allowed, to the employers by the contractor, in case the latter fails to complete the works by the date fixed in the contract for their completion.

Sometimes the contract provides, by way of inducement, bonuses to be paid to the contractor for earlier or punctual completion, coupled with the penalties or liquidated damages for delay. In order to claim such bonuses, the contractor must complete at the time they become due under the contract; or he must be able to show that he has been hindered by the employer or his architect. In *Leslie & Co. v. Metropolitan Asylums Board* (1901), 68 J.P. 86, there was a contract which included a penalty for delay in completion, and a bonus for punctual completion. Sub-contractors appointed by the architect caused delay to the general contractor, who, it was held, was entitled to the bonus provided for punctual completion.

If the employer himself, or through his architect, prevents performance by the contractor, the latter can recover from the employer damages for any extra cost he has been put to in carrying out his contract. In certain circumstances the contractor can treat the prevention as a breach at the outset, but if he elects to complete the contract, he will be relieved from any liability for delay, and can still sue the employer for the contract price, together with damages for extra cost to him, as indicated. "P. W. G." does not make it clear what the penalty clause in his case includes; and a perusal of the document containing the clauses is necessary to give him a specific answer; but the above will, no doubt, be sufficient to show what claim he can make.

PENALTY.

REGIONAL PLANNING IN LONDON AND ITS ENVIRONS

IN the course of a paper on this subject, given last week before the London Society, Mr. G. L. Pepler, F.S.I. (Past President of the Town-Planning Institute), said that regional planning was now well established in the country: thirty-two Joint Town-Planning Committees had been constituted, embracing, altogether, some 500 local authorities and covering a total area of over 5,000,000 acres, or about 8,000 square miles. The largest region being planned as a unit was that for the Manchester district, which comprised 96 local authorities and covered an area of over 1,000 square miles. This might be compared with the area dealt with by the Greater London Arterial Road Conferences, which covered 1,083 square miles, including the district usually called Greater London, which has an area of 693 square miles (103 Town-Planning Authorities) and in 1923 had a population of nearly 7,500,000 and total assessable value £67,235,000. The London and Home Counties Traffic Advisory Committee covered about 2,000 square miles. This compared with 5,500 square miles, the area now being dealt with in the regional plan being prepared for the City of New York and its environs.

Having referred to the Arterial Road Conferences, summoned by the Right Hon. John Burns, as President of the Local Government Board, in 1913, the speaker said that subsequently the London Society produced a plan that included not only the arterial roads (then suggested) but also a far-sighted scheme of regional open spaces.

There seemed a general consensus of informed opinion (continued the speaker) that a comprehensive plan was required for the London Region, but there was difference of opinion as to the extent of that region. A useful start could be made with the region proposed by the Royal Commission on London Government for the operations of a London and Home Counties Advisory Committee. This roughly extended to a radius of 25 miles from the centre. The Royal Commission recommended that such an Advisory Committee should advise the appropriate Ministers upon the following matters, with a view to co-ordination within their region:—(1) Transport; (2) Town Planning, in relation to transport; (3) Housing, as part of Town Planning in relation to an equitable distribution of population; (4) Main Drainage—new facilities and combination between authorities.

Since the Royal Commission reported, a London and Home Counties Traffic Advisory Committee had been constituted, and had as its chairman Sir Henry Maybury. Its powers were, however, not so wide as was recommended by the Commission and were practically limited to matters relating to traffic.

Although no comprehensive general plan of development was yet under way for the whole region, considerable and encouraging progress had been made in planning large sections of it, by the following Joint Town-Planning Committees, whose constitution was made possible by the Town-Planning Act of 1919:—

West Middlesex.—This Committee was formed, consequent upon a conference held in October, 1921. The area dealt with covered an area of about 72,258 acres or approximately 113 square miles, including that portion of Middlesex extending westward from London County at Chiswick, as far north as the south boundary of Rickmansworth. Eighteen local authorities had combined together for the purpose of preparing a comprehensive plan. Messrs. Adams & Thompson were instructed to prepare a plan and report, in consultation with the local officials. Two reports had been published; the first covered the preliminary survey, including the issue of a questionnaire to the industrial concerns in the region, and the marshalling of data and facts upon which the proposals of the final report were based. The main proposals might be grouped under

two principal headings:—(a) The broad allocation of the use to which the land should be put (*i.e.*, zoning); (b) lines of communication to meet the needs of those uses economically and efficiently. Under the first heading land specially suited for the following five predominant uses was indicated:—Industrial, business, residential, recreational, agricultural.

The principal proposals regarding open spaces were:—Three main concentric belts of open land, namely, along the banks of the Rivers Brent, Crane and Colne and Weyardisbury. This should have the effect of making definite, if rather narrow, breaks in the expansion of London, thus avoiding a repetition of its unending sprawl which made it impossible to disentangle one area of local government from another. Other proposed large park reservations included such places as Osterley, Gunnersbury (now in course of realisation) and Syon Parks. The importance of preserving land for agriculture was also emphasised and suitable areas indicated. With reference to communications, a broad framework of roads was proposed and suitable sections and building lines indicated for each type; recommendations were also made with reference to improved connections that might with advantage be provided in respect to railways.

Thames Valley.—This Joint Committee comprised eleven local authorities, some in Surrey and some in Middlesex, and covered about 30,475 acres in the Thames Valley, from Barnes up to Weybridge, with a gap at Kingston due to the abstention of that Borough. The same specialists were employed as in the case of West Middlesex, and again two reports had been produced. Walton Urban District joined the Committee after the reports had been published. The region was rich in parks and was described as London's greatest playground. The dominant use, therefore, allotted to it was for residence and recreation. Proposals were made for preserving the banks of the River Thames and for linking up the parks by a series of parkways.

South Essex.—This region lay along the Thames, at the opposite end of London, stretching eastward from West Ham to beyond Southend, and extending back to Billericay. Some 10,000 acres, adjoining the river, were available for industrial purposes and a considerable portion of this was already bespoken. In the main, therefore, the industry of the region (into which London, and notably the London County Council, had already made dormitory incursions) would be derived from the River Thames, and one of the objects of the Committee—which is just beginning to get into its stride—was to make the region as self-contained and as little physically dependent on London as possible. The whole area called urgently for a bold, comprehensive plan, or chaos and inefficiency must ensue.

North-East Surrey and West Kent.—This region embraced eleven local authorities, in two counties, including Merton and Morden on the west and Bromley Rural District on the east, with the County Borough of Croydon midway between. It was predominantly residential in character, although it included London's Air Port, and it was the desire of the Joint Committee that this character should be retained. Most of the constituent councils were already well advanced with their town-planning schemes when the Joint Committee was formed, and therefore the function of that body had principally been to co-ordinate proposals and to promote harmony and unity of purpose.

North-West Kent.—This region overlapped the last-mentioned and extended from the boundary of Surrey, in a north-westerly direction up to the River Thames, and southward included Sevenoaks and Sevenoaks Rural District. All the authorities invited had not

yet joined, but eleven of them were co-laborating, covering an area of about 153,000 acres, and had instructed Mr. W. R. Davids to prepare an outline plan and report.

South-West Kent.—Sevenoaks Urban District Rural were also members of this Joint Committee, whose region embraced eleven authorities and included the Rural District of Godstone on the west and the Borough and Rural District of Maidstone on the east, and extended southward into Sussex, in respect to the Parish of Frant. It was the desire of the Committee that the region should be complete the symmetry of the region. The Committee were giving careful consideration to the question of communications, but one of their chief concerns was to preserve the beautiful countryside and the charming villages that it contained.

Hertfordshire.—All the Committees previously mentioned were working in consultation with the officials and representatives of the counties in which they are situated, but Hertfordshire was the first county to take the initiative and, with the encouragement of the Minister of Health, arrange for all the authorities in the county to form a Joint Town-Planning Committee.

The work in hand and accomplished by these Joint Town-Planning Committees was encouraging and in no way prejudicial to the preparation of a composite plan for the whole, for, as the Arterial Road Conferences proved, and as had been found in the Manchester and Midland Regions, in practice the whole would have to be divided into sections of workable size.

It was a little disappointing to find that Greater London, having been first with a regional plan for arterial roads, should be outstripped by New York in respect to a complete general plan; although we could feel some satisfaction that Mr. Thomas Adams was now General Director of Plans and Surveys for the New York Regional Plan covering 5,500 square miles.

Fine as the sectional regional planning round the centre had been, it was clear that the needs of the whole region of London could not be envisaged nor a plan prepared that should meet those needs until the whole, including the centre and the outer fringes, was treated as one unit for the purpose of study and planning. For example, no satisfactory policy of satellite towns or agricultural belts or of decentralisation was possible unless it embraced the whole region and took into account the circumstances, requirements and feelings of each part.

We could no longer afford the immense and continuous waste that was involved in the haphazard use of land. We could not afford to do without an orderly general programme of development. Next year Sir Henry Maybury expected that there would be an additional 500,000 motors on the roads of the country. The prospect was indeed appalling and it would seem that a cumulative catastrophe could only be averted by local authorities, Government departments, business interests, landowners and all progressive agencies and persons getting together immediately to prepare a programme of development and reconstruction that by a process of decentralisation and redistribution would re-sort things into their proper place, that would provide for some elbow room and amenity in the centre, would preserve us some countryside, and would provide for the best conditions for work, for homes and for recreation.

French Chateau Destroyed.

The historic chateau of Preuniers, in the Hautes Alpes, has been destroyed by fire. Built in the thirteenth century, it was subjected to repeated assault during the religious wars in the Savoy against the Bourbons, and later during the 1793 Revolution. Very little of the valuable furniture which it contained was saved and the damage is estimated at several millions of francs.

THE BUILDING TRADE

HINTS TO BUILDERS

By J. H. BARNES, F.I.O.B.

ANKING AND STRUTTING TO TRENCHES.

WHEN trenches have been excavated it is necessary to support the sides by the usual method of planking and strutting, viz., by fixing the poling boards against the earth and keeping them in position with waling and struts. In some kinds of soil the sides of the trench would be sufficiently firm not to need planking, but trenches are usually open for some period till the foundations have been approved, it is advisable to have them strutted so as to obviate any possibility of a slip in the ground should any heavy rains occur, or through the vibration of heavy traffic in the neighbourhood.

In the case of good solid ground the poling boards may be placed fairly widely apart, but where the soil is loose rubbish or sand, the poling boards must be placed more closely together. Where the excavation is in loose rubbish it will be necessary to board the sides with long runners, driven down in advance of the general excavation to prevent the sides from slipping in.

If there is a little water running through the sub-soil, and there is a risk of a certain amount of mud or sand being dislodged, it may be advisable to pack behind the poling boards with sacks filled with shavings so as to keep back the water temporarily. Where excavations have to be made adjoining public thoroughfares, it will be necessary to plank and strut the sides of the excavation and erect a series of heavy raking shores to withstand the thrust caused by the weight of the traffic, &c.

Where there is a large amount of heavy traffic passing immediately alongside the site, greater should be taken to avoid any slip from vibration and such causes, in addition to which there is always the possibility of a water main, the street leaking, which may interfere with the soil under the roadway which is being supported. The safest plan, where the arrangements for the work permit, is not to undertake the whole of the street frontage of the excavation at one time, but to do the work in sections by excavating a portion of the site and planking, strutting, and shoring its vertical face and laying foundations for and building the retaining wall before commencing the next section of excavation, so as not to have the whole of the frontage to the street at hazard. This system could require the use of less timber, as the stuff could be utilised in the other sections as they come along.

Shoring and Underpinning.

It is a very usual occurrence to find in a contract for building work in London or elsewhere some clause relative to the shoring of adjoining buildings during underpinning, demolition, or other operations. Shoring is sometimes described in detail, the number of shores required—whether rakers or flyers—being given, together with the scantlings of the timber, the positions in which they are to be fixed, or the approximate distance apart. Where all the shoring required on a job is the subject of definite instructions, and detailed particulars are given in the specification, it is but a matter of routine for the work to be carried out in accordance therewith.

In many instances the risk and responsibility are placed upon the builder by some clause in the contract documents stating that the adjoining buildings are to be shored, upheld and maintained during the progress of the new building, when the builder or his staff must determine the style and description of shoring required, if any. In some cases it may be found that shoring is not vitally necessary, but all the people concerned would like a few shores to be fixed as a general safeguard to the property.

In another instance the adjacent building

may have a distinct tendency to become dangerous, and in such cases careful shoring is necessary so that the situation may not get out of hand; or the adjoining building may be positively dangerous, and the shoring in such cases must be done with great care and to the approval of the architect and local authorities.

If the job is of an important nature it may be necessary for the engineer or architect to calculate carefully the weight to be carried and design the shoring to suit the building it has to support, but in ordinary cases it is left to the builder to fix such shores as his experience leads him to think will be necessary.

Where there is no obvious necessity for shoring, and such work is only required to exert a beneficial influence on the adjoining structure, some rule-of-thumb methods are all that are needed for determining the sizes of the timbers for raking shores, and the distance they may be required to be fixed apart. The shoring will probably be placed on the site of the operations for the new building, and the point at which they are to be fixed must be settled as far as possible to work in conveniently with the new building and to such a depth as to be on the proper level to work in with the new foundations.

It is usually found that 6 in. by 6 in. or 7 in. by 7 in. square pitch pine would be a sufficient scantling for raking shoring to a building about 30 ft. high, and 9 in. by 9 in. or over square timber for a building 45 ft. high, with 3 in. by 9 in. wall plates and 4 in. by 9 in. or 4 in. by 11 in. sole plates.

The general form of a raking shore is too well known to need description, but if necessary the young builder should consult the text books on the subject for details. The raking shores where possible should have a needle in the wall plate fixed at such a level that it comes just underneath the floor in the adjoining building so as to assist, if necessary, in taking the weight. The foundations for the sole plate of the rakers should be either on firm ground or on a temporary concrete base. The shores should, wherever possible, be of square timber or pitch pine, not deals or planks, as it is considered they may have a tendency to bend should any weight come upon them, although there is no objection to deals or planks being bolted together to form a square section of timber where it is not possible to get a long squared timber into the building.

Arrangements for shoring adjoining premises should be made while the old buildings are being demolished, and care should be taken to deal with each part of the work which upon exposure appears to be dangerous. When ends of old floor beams have been removed from the party wall large holes may be left in the brickwork, and these should be temporarily made good in brickwork. Where possible it is advisable to leave old floor beams in position to act as temporary struts to the walls on which they rested.

Where the building work has to be carried on immediately adjoining a modern building it will usually be found that the brickwork, &c., of such building is in reasonably good condition and will not require any great amount of shoring, unless some definite work such as underpinning is contemplated and/or if it is proposed to construct the new building with one floor below the adjoining premises.

In old buildings the brickwork is sometimes found to be of a rather inferior kind, with little or no bond and very poor mortar, and sometimes the facing bricks are not connected to the brick wall at the back, being only $4\frac{1}{2}$ in. of superior brick but without any proper bond or connection to the common brickwork behind. In such instances there is always a danger of the facing

brickwork bulging out and becoming defective, and if the "needle" to the shore is only inserted to the back of the brick facings this in itself may tend to cause some movement as the thrust of the raker becomes effective.

It is not unusual to find that the front wall of the adjoining house has not been bonded or connected in any way to the return or party wall. This can be dealt with by fixing some iron straps to a timber wall plate on the street front of the building, and by securing the iron bar into the brickwork some six or seven feet away from the front to stop, if necessary, any tendency of the front wall to move outwards.

It will often be found that the old chimney breasts have not been bonded or connected in any way to the adjoining wall, and these had better be removed, otherwise the chimney breast, if substantially built, should act as a pier or buttress to the main party wall.

The defective work indicated above will usually be found in comparatively low buildings where no very great height of shoring will be required. It is sometimes more advantageous to fix flying shores than raking shores, as the flying shore can exert more thrust at the required position and is more likely to be out of the way of the general building operations, although care must be taken not to allow the raker to place too much weight on the wall to be shored, which will sometimes occur if the whole weight of the flying shore is carried on the needle which is morticed into the brickwork.

Needling and Shoring for Underpinning, or Forming Door Openings and Similar Work.

Such work is usually at the risk of the builder. It should be borne in mind that for small openings in a well-built brick wall the brickwork may be cut away without shoring, as the brickwork over the opening would form itself into natural corbels to carry the brickwork over, and exactly how far it may be safely calculated on this being done will entirely depend upon the kind of brickwork to be dealt with. So as to obviate some of the needling and shoring it may be found possible to cut away half the brick wall on one side and insert a rolled steel joist, which will probably be required as a lintol, afterwards cutting away a chase in the wall on the other side to put in the remaining joist as lintol, and the brickwork below can then be cut away and the opening formed.

These, as a rule, are only simple cases and should present no difficulty, but where it is found to be necessary to take out a large portion of the party wall and support the brickwork above on a girder so as to connect one building with another, this may be a more hazardous operation. In such cases shoring would consist of the necessary number of sets of shores, each set consisting of two upright or dead shores and a horizontal beam or needle on top, either of square timber or steel joist. The size of the upright timbers or dead shores and steel joist as needle would depend upon the weight to be carried, of which careful calculation should be made. The advantage of using a steel joist as a needle is that it is possible to pin up the wall between the steel joist and the brickwork over with slates and cement and thus reduce the possibility of any movement in the structure over, which may occur if the "needle" is not properly bedded to the brickwork over.

When the shores have been erected a suitable distance apart and braced where necessary, the brickwork requiring removal may be demolished. Care should be taken in arranging the positions of the shores and needles so that they will not be in the way when inserting the girder or other steelwork carrying the brickwork over. Care should also be taken to relieve wherever possible the wall, which has to be underpinned, of the weight in any flooring which may be bearing thereon. Where any great weight is to be carried it is usual to fix the needles about 4 ft. apart, but this must depend upon the requirements of the job itself.

THE WEEK IN PARLIAMENT

WESTMINSTER, Wednesday.

Result of 1924 Act.

Mr. N. Chamberlain informed Mr. Day that on November 1 last, the latest date for which complete figures were available, the position under the Housing Act, 1924, was as follows:—

	Act of 1924.
1. Number of houses completed.....	15,122
2. Number of houses under construction.....	30,956
3. Number of houses definitely arranged for but not started.....	24,046
4. Number of houses authorised but not definitely arranged for.....	20,202

Total number of houses authorised 90,326

A Conference on Overcrowding?

Mr. Thurtle asked the Minister if he would convene a meeting of representatives of the London County Council and the London borough councils to confer with him on the subject of measures to be taken to deal more expeditiously with the overcrowding existing in the London area?

Mr. N. Chamberlain said that he did not think that such a conference would serve a useful purpose at present. The remedy for overcrowding was the building of more houses. Apart from the provision by private enterprise and by the Borough Councils, the London County Council had adopted a very large programme of house building which they were endeavouring to carry out as fast as the resources of the industry permitted.

Rural Schemes.

Mr. N. Chamberlain informed Mr. C. Edwards that 184 rural district councils had so far received approvals of schemes under the Housing (Financial Provisions) Act, 1924.

Four in One Room.

Mr. N. Chamberlain informed Mr. Thurtle that the number of rooms in the administrative County of London occupied by private families living at an average density of four or more persons per room was 18,847 at the Census of 1921.

Position in East Ham.

In reply to Mr. Barnes, who asked for the number of houses erected for sale and for letting purposes in the borough of East Ham since the war under the various Housing Acts, together with the total amount of the subsidies paid or payable on those built or building under the respective Acts, Mr. N. Chamberlain said that the following table gave the desired information:—

Acts.	Houses Authorised.	Houses Completed.	By Local Authority or Private Enterprise.	Subsidy Paid or Payable.
Housing, Town Planning, &c., Act, 1919	36 ..	36 ..	{ Local Authority ..	{ No subsidy payable, as the estimated annual deficit is covered by the proceeds of a 1d. rate
Housing (Additional Powers) Act, 1919	7 ..	7 ..	{ Private Enterprise ..	
Housing, &c., Act, 1923 ..	1,214 ..	799 ..	{ Private Enterprise ..	{ £1,760 (capital payment) .. £7,284 annually for twenty years

He had no information as to the extent to which the houses provided by private enterprise had been let. The houses built by local authority were let.

Price of Light Castings.

Mr. R. Morrison asked the Minister of Health whether he had yet received the report of the Committee on the prices of building materials with reference to the increase of the prices of articles controlled by the National Light Castings Association; and, in view of the chairman of

the Committee's Report for July, which drew his attention to further increases in the prices of light castings, what action he now proposed to take?

Mr. N. Chamberlain said that arrangements were made by the Committee with the National Light Castings Association for an accountancy investigation. Such an investigation was necessarily a task of considerable magnitude, but he understood that the accountant's report would be submitted to the Committee very shortly. As regarded the last part of the question, there had been no further increase in the price of light castings; the comparison made in the report was between the prices prevailing in August, 1924, and July, 1925.

Smoke Abatement.

Asked by Mr. Erskine whether he was aware that it had been calculated that at least 1,000,000 bushels of soot fell over London on the two days preceding last week's black fog; and would he take steps to bring in a Smoke Abatement Bill at the earliest possible date, in view of the damage to health, property and industry which smoke and fogs created, Mr. N. Chamberlain said he was not aware where his hon. friend got his estimate or on what it was based, but he had already stated that it was his intention to introduce next Session a Bill dealing with smoke.

Unemployment in Southwark.

Mr. N. Chamberlain informed Mr. Day that his information was that while there was unemployment in certain branches of the building industry in the Borough of Southwark, there was practically no unemployment in key trades such as bricklayers, plasterers and slaters.

Housing Position in Scotland.

Sir J. Gilmour, Secretary for Scotland, informed Sir G. Collins that the number of houses in Scotland approved for subsidy to October 31, 1925, under the Housing, &c., Act, 1923, was 14,901. The present capital value of the Exchequer subsidies payable on those houses was estimated at approximately £1,146,100. In addition, slum clearance schemes involving the erection of 7,450 houses had been approved under this Act, fifty per cent. of the annual deficit on which would be borne by the Exchequer. It was not possible at present to give an estimate of the capital value of the subsidy in respect of these houses. The number of houses in Scotland approved for subsidy to October 31, 1925, under the Housing (Financial Provisions) Act, 1924, was 12,291. The present capital value of the Exchequer subsidies payable on these houses was approximately £1,977,800. Information was not available as to the capital values of the additional subsidies granted by local authorities in respect of these houses.

regretted he was unable to give an unequalled undertaking to this effect.

St. Paul's Bridge Scheme.

Mr. Day asked the Minister of Transport if he would state the present position in regard to proposed St. Paul's Bridge scheme.

Colonel Ashley replied that he had referred the question to the London Traffic Advisory Committee and hoped to receive their recommendations as soon as they had had time to study the wider problem of Thames bridges as a whole.

Brigade of Guards Memorial.

Captain Crookshank asked whether the designs of the Brigade of Guards war memorial now being erected on the Horse Guards Parade were submitted to, and approved by, the Fine Arts Commission.

Captain Hacking said that the design of the memorial was selected by two assessors appointed by the Royal Academy and accepted by the First Commissioner on the day before the Royal Fine Arts Commission was appointed. The First Commissioner regretted that at the late stage he was unable to reopen the subject.

Town-Planning Schemes.

Sir K. Wood informed Lady Astor that nine town-planning schemes had been finally approved since January 1, 1920, and eleven other schemes had been submitted to him for approval. In addition, 64 preliminary statements of proposals to be included in schemes had been approved, and orders issued for securing development accordingly, and 60 others had been submitted for approval. The number of local authorities promoting the schemes and preliminary statements approved and submitted for approval was 90, and the total number of local authorities now formally engaged in the preparation of schemes was 310. The Minister of Health had reason to suppose that preliminary surveys were being carried out by a number of other authorities.

Unemployed.

Mr. Betterton, Parliamentary Secretary to the Ministry of Labour, informed Mr. Day that on October 26 the number of insured work people in the building trade of Great Britain recorded as unemployed was as under:—

Carpenters	2,864
Bricklayers	911
Masons	781
Slaters	193
Plasterers	202
Painters	18,230
Plumbers	1,521
Labourers	24,377
Other workers in the Building Trade	20,313

69,392

Deterioration of Structures in Sea-water.

The Committee of the Institution of Civil Engineers, which has been investigating the deterioration of structures of timber, metal and concrete in sea-water since 1916 with the assistance of grants from the Department of Scientific and Industrial Research, has prepared a fifth (interim) report which is now published by H.M. Stationery Office for the Department. This present issue has been edited by Mr. P. M. Crosthwaite, B.A., M.Inst.C.E., Secretary to the Committee, and Mr. Gilbert R. Redgrave, Assoc.Inst.C.E., and contains reports on the comparative corrosion of steel at Colombo, Halifax, Plymouth and Auckland; on the investigations of raft and test pieces at Plymouth; on the painting of steel plates; on defects noticed in Admiralty reinforced concrete structures; on marine pile investigations of the National Research Council (U.S.A.); on the disintegration of cement and concrete in sea-water, and many other similar reports. A copy of this report can be obtained from Adastral House, Kingsway, W.C.2, price 3s. 6d.

The Public and War Memorials.

Captain Crookshank asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, whether he would arrange that before any war memorial, statue, &c., was erected in the London area, full-sized models should have to be put up, as was done in the case of the Cenotaph, in order that the views of the general public might be expressed.

Captain Hacking said the First Commissioner

NEW BUILDINGS IN LONDON.

Barking.—Mr. C. J. Dawson, F.R.I.B.A., Lock House Chambers, Barking, architect to the Barking U.D.C., has designed a new central school building in Wilmington-gardens to accommodate 640 scholars.

Barkingside.—In connection with the completion of the Horns-road Estate Housing Scheme, it is proposed to construct new roads and lay sewers, &c. Plans by Mr. H. Shaw, I.Inst.C.E., Town Hall, Ilford.

Barnet.—The Governors of the Queen Elizabeth Girls' Grammar School are to enlarge their premises and have accepted the tender of Messrs. R. Ginn & Son, Hertford, at £14,780. Mr. J. W. Fisher (Messrs. Brown & Fisher), architect, Burystead-place, Wellingborough. Mr. P. J. J. Panter, quantity surveyor.

Bermondsey.—H.M. Office of Works, Storey's Gate, Westminster, S.W.1, have prepared plans for an employment exchange. Messrs. A. Roberts & Co., Ltd., builders, 74, Earl's Court-road, Hammersmith, W.8. Messrs. Somerville-Barnard Construction Co., Ltd., steelwork, Archangel Works, S.E. Messrs. Malcolm McLeod & Co., Ltd., patent stone, Glen-road, E.17.

Bethnal Green.—Tenders are under consideration for the removal of the present roof and the erection of a new flat roof and other alterations at Ward Block E at the Bethnal Green Hospital in Cambridge-road, E.2. Messrs. Meakin, Archer & Co., architects to the B.G., 73-76, King William-street, E.C.4.

Billiter-street.—No. 18, Billiter-street, E.C.3, has been demolished to make way for an office building of six stories. Messrs. F. G. Minter, Ltd., builders, Ferry Works, Putney, S.W. Messrs. Gunton & Gunton, F.R.I.B.A., architects, Finsbury House, Blomfield-street, E.C.

Blomfield-street.—Steelwork is now in course of erection for the office building at the corner of Blomfield-street and New Broad-street, E.C.2. Messrs. Walter Lawrence & Son, Ltd., builders, 9, Finsbury-square, E.C.2. Messrs. Moreland, Layne & Co., Ltd., 80, Goswell-road, E.C.1. Steelwork, Messrs. M. E. & H. O. Collins, architects, 115, Old Broad-street, E.C.2.

Croydon.—A telephone exchange is to be erected for H.M. Postmaster-General to plans prepared by H.M. Office of Works, Storey's Gate, S.W.1. Messrs. Galbraith Bros., Ltd., contractors, 63, Waterloo-street, S.E.5. Messrs. Drew-Bear Perks & Co., Ltd., steelwork, 30, Grosvenor-place, S.W.1.

Devonshire-square.—Messrs. B. Goodman, Ltd., 88, Haggerston-road, E.8, are demolishing old buildings at No. 2, Devonshire-square, E.C.1. Messrs. Trollope & Colls, Ltd., 5, Coleman-street, E.C.2, are to erect new premises on the site.

Duke-street.—Messrs. Horne Bros., Ltd., 90, Oxford-street, W.1, are to build a branch shop, with offices above, on a site at the junction of Duke-street and Oxford-street, W.1. Messrs. Higgs & Hill, Ltd., builders, Crown Works, South Lambeth-road, S.W.8. Messrs. Vimperis, Simpson & Guthrie, architects, 37, Bruton-street, W.1.

East Dulwich.—Improvements and redecoration are to be effected at the hospital in East Dulwich-grove, S.E., for the Southwark B.G. Messrs. A. Saxon Snell & Phillips, architects 9, Entinck-street, W.1. Mr. D. C. Bowyer, milder, Woolwich-road, Belvedere, S.E.

East Finchley.—Messrs. Chessums, Ltd., Imperial Works, Portland-road, N.15, are the contractors for the enlargement of the East Finchley Congregationalist Church, N.2, which to cost £6,500. Messrs. Elcock & Sutcliffe, architects, 21, Northumberland-avenue, W.C.2.

Edgware.—A row of shops with living accommodation above is to be built in the Mall, under the direction of Messrs. Cross & Cross, surveyors, High-street, Edgware.

Edgware-road.—Messrs. Patman & Fotheringham, Ltd., builders, 15, Park-street, Islington, N.1, are erecting a large block of shops, offices and flats on a site at Nos. 45-49, Edgware-road, N.2. Messrs. George A. Lansdown & Brown, architects, 9, Regent-street, S.W.1.

Epping.—Forty-six residences are to be erected by the Epping R.D.C. to the plans of Messrs. Tooley & Foster, F.R.I.B.A., architects, Buckhurst Hill. Mr. C. J. Smith, builder, Abridge, Essex.

Fetter-lane.—Stokes-court, in Fetter-lane, E.C.4, is to be closed by the City of London Corporation, and Messrs. Thomas Wallis & Co., Ltd., Holborn-circus, W.C., are to absorb part of it. The new building is being designed by Messrs. Yetta, Sturdy & Usher, architects, 115, Moorgate, E.C.2.

Fulham.—Additions are to be made at the hospital at St. Dunstan's-road, Fulham Palace-road, S.W.6. Messrs. A. Saxon Snell & Phillips, architects, 9, Bentinck-street, Manchester-square, W.1. Messrs. W. H. Wagstaffe & Son, builders, London.

Great Portland-street.—The site bounded by Great Portland-street, Oxford-street and Market-place, W.1, has now been cleared preparatory to the building of the second section of Messrs. Peter Robinson's premises. Messrs. Higgs & Hill, Ltd., contractors, Crown Works, South Lambeth-road, S.E. Messrs. T. P. & E. S. Clarkson, 17, Burlington-street, W.1, and Mr. H. Austen Hall, 6, New Burlington-street, W.1, are acting as joint architects.

Gunnersbury.—Plans have been prepared by Mr. A. G. S. Lyford, builder, West Lodge, Acton, W.3, for the development of a part of the Gunnersbury Estate at Ealing.

Hackney.—Work is about to commence upon the erection of the proposed Hackney Institute, which is to be built for the L.C.C., at a cost of £60,000. Messrs. L. H. & R. Roberts, builders, 144, Lower Clapton-road, E.5. Mr. G. Topham Forrest, F.R.I.B.A., architect, County Hall, S.E.1.

Hammersmith.—A new elementary school is to be erected by the L.C.C. on a site acquired in Lena-gardens, W. Mr. G. Topham Forrest, F.R.I.B.A., architect.

Houndsditch.—Work is in progress on the vacant site in Houndsditch and Creechurch-lane, E.C., where Messrs. S. Lesser & Co., Ltd., are to erect new business premises. Messrs. Griggs & Son, builders, 100, Victoria-street, S.W.1. Messrs. Lewis Solomon & Sons, architects, 133, Moorgate, E.C.2.

Hounslow.—A group of 70 houses is to be erected on the Lampton Hills Estate in Kingsley-road, which has been acquired by Messrs. Perry Bros., 48, Uxbridge-road, W.5.

Ilford.—Messrs. Haines & Warwick, builders, Vicarage Works, Seven Kings, are erecting seven houses in 94-106, Wards-road East, and 16 houses in 19-49, Vicarage-lane.

Kingsland-road.—Alterations are to be made to the bakehouse, &c., at St. Leonard's House, Kingsland-road, N., for the Guardians of the Poor of the Parish Church of St. Leonards. Mr. F. Danby Smith, F.R.I.B.A., architect, Parliament Mansions, Victoria-street, S.W.1.

Leicester-street.—New premises for display purposes are being erected by Messrs. Staggs & Mantle, Ltd., drapers, Leicester-square, W.1. Messrs. Hall, Beddall & Co., Ltd., builders, Waterloo-bridge, S.E.1. Mr. E. F. Dickens, architect, 6, Warwick-court, Gray's Inn, W.C.

Leicester-square.—Messrs. Vigor, Ltd., builders, Knightsbridge, S.W.1, are erecting the second section of the building in Leicester-square, and Whitcomb-street, W.1, for the Automobile Association. Mr. Andrew Mather, architect, 38, John-street, W.C.1. Messrs. Smith-Walker, Ltd., steelwork, Tothill-street, Westminster, S.W.1.

Lewisham.—Re-decoration works, &c., are to be carried out at the married quarters at the Ladywell Institution, Ladywell-road, S.E., to specifications prepared by Messrs. Newman & Newman, architects, St. Thomas-chambers, Railway Approach, S.E.1.

Lewisham High-street.—Messrs. Lloyds Bank, Ltd., Lombard-street, E.C.3, are to open a new branch at No. 79, Lewisham High-street, S.E.13, as soon as the necessary structural alterations are completed. Messrs. Holliday & Greenwood, Ltd., builders, Stewart's-road, Battersea, S.W.8.

Leyton.—Leyton U.D.C. have decided to build a special school at Knott Green. Mr. John H. Jacques, L.R.I.B.A., architect, 61, West Ham-lane, Stratford, E.15.

Mile End.—The L.C.C. Education Committee recommend the building of a new school to accommodate 1,124 scholars on a site in Cephas-street. Mr. G. Topham Forrest, F.R.I.B.A., architect.

New Coventry-street.—The premises at the corner of New Coventry-street and Rupert-street, W.1, have been acquired by Messrs. Keith, Prowse & Co., Ltd., 159, New Bond-street, W.1. Extensive alterations are to be made.

Newgate-street.—Messrs. Style & Mantle (S. & M.), Ltd., costumiers, 3, Newgate-street, E.C.1, have purchased No. 4, Newgate-street, which they propose to adapt as their new head showrooms and offices. Messrs. J. Bennett, Ltd., builders, 93, Parkhurst-road, N.7.

Oxford-street.—Good progress is being made with the rebuilding of the emporium of Messrs. Bourne & Hollingsworth, drapers. Messrs. F. G. Minter, Ltd., builders, Ferry Works, Putney, S.W. Messrs. Samuel Haskins & Bros., Ltd., shop fitters, Walthamstow, E.17. Messrs. Slater & Moberly, A. & F.R.I.B.A., architects, 46, Berners-street, W.1.

Piccadilly.—A building of shops and flats is to be erected at No. 81, Piccadilly, and 1, 2, 3, Bolton-street, W.1, by Messrs. R. M. Phillips, Ltd., 22, Conduit-street, W.1. Messrs. Griggs & Son, builders, 100, Victoria-street, S.W.1. Messrs. London & Wales Steel Construction Co., steelwork, 44, Bedford-row, W.C. Messrs. F. J. Barnes, Ltd., Portland stone, 25, Nine Elms-lane, S.W.8. Messrs. Trehearne & Norman, architects, Windsor House, Kingsway, W.C.

St. Paul's Churchyard.—The Dolcis Shoe Co. are building a new stores and show-room facing the Cathedral, to the plans of Mr. W. Henry White, F.R.I.B.A., architect, 14a, Cavendish-place, W.1. Messrs. F. D. Huntington, Ltd., Broadway-chambers, Hammersmith, S.W., builders; Messrs. Aston Construction Co., Ltd., steelwork, Eagle Wharf-road, Hoxton, N.1.

Smithfield.—New buildings are to be erected at the London Central Markets, E.C.1, and a contract for sub-structural work has been placed with Messrs. Holliday & Greenwood, Ltd., 11, Buckingham Palace-gardens, S.W.1.

Stamford Hill.—New buildings are being erected at the Stamford Hill Stores Depot, for the L.C.C. Messrs. Allen Fairhead & Sons, Ltd., Enfield, builders. Mr. G. Topham Forrest, F.R.I.B.A., architect.

Teddington.—Steelwork for the new Research Laboratory at the Teddington Physical Institution to be erected for the Admiralty is to be supplied and erected by Messrs. Archibald D. Darnay & Sons, Ltd., Steelworks-road, Battersea, S.W.

Twickenham.—The London Co-operative Society, Ltd., are to acquire premises in York-street for a new drapery stores. New shop fittings and fronts will be installed.

Victoria-street.—An office building with shops on the ground floor is being erected at the corner of Victoria-street and Arlington-street, S.W.1. Messrs. Holliday & Greenwood, Ltd., builders, Stewart's-road, Battersea, S.W. Mr. J. Stanley Beard, architect, 52, Baker-street, W.1.

Waterloo-road.—It is proposed to build a new nurses' home at the Royal Waterloo Hospital, at the corner of Waterloo-road and Stamford-street, S.E.1, to the plans of Messrs. Waring & Nicholson, 38, Parliament-street, S.W.1.

Whitefriars-street.—Large printing works are being erected on the site of the old Whitefriars Glassworks, in Whitefriars-street and Tudor-street, E.C.4, for Messrs. Associated Newspapers, Ltd. Messrs. Allen Fairhead & Sons, Ltd., builders, Sydney-street, Enfield. Messrs. Herbert O. Ellis & Clarke, architects, 3, Old Queen-street, Westminster, S.W.

Willesden.—Mr. F. R. Hipperson, Norwich, is erecting a new nurses' home at Willesden, N.W.10.

Woolwich.—The War Office propose to make additions to the Royal Herbert Hospital, S.E. Mr. F. R. Hipperson, builder, 6, Broad-street-place, E.C.2.

TRADE NEWS

A Quick-drying Cement.

It is often the case nowadays that a whole job is "hung up" for a comparatively considerable time to allow of the concrete setting; it is dangerous to erect any superstructure, fix a facing or veneer, or compel it to perform its function until it has completely hardened. This waste of time, which means a loss of money and possibly reputation, can be partially avoided by using Kaye's cement, which, its makers claim, has in two days a degree of hardness nearly double that called for by the usual specification in one week, and shows a steady growth in strength with age.

Fire-escape and Service Staircases.

To protect the occupants of buildings against the danger of fire it is essential that adequate means of escape should be provided, and such means must be in accordance with the provisions incorporated in the London Building Acts. Messrs. H. & C. Davis & Co., Ltd., of 1, The Pavement, Clapham, S.W. 4, have had many years' experience in the designing, construction, and erection of all types of iron fire-escapes and service staircases, and have carried out work in this connection in all parts of the United Kingdom. Some of their more important contracts include work for H.M. Office of Works, the War Office, the Old Bailey, the County Hall, Westminster; and No. 10, Downing-street.

Woodworkers' Tools and Machines.

We have received from Messrs. Richard Melhuish, Ltd., of 50, Fetter-lane, Holborn, E.C. 4, their new catalogue of woodworkers' tools and machines. This catalogue is most comprehensive, and includes the very latest patterns. There are 1,100 illustrations, and every tool required for the amateur and mechanic is embodied in the list, which latter is very completely yet simply indexed. To the quality of these goods no greater testimony is required than the fact that the firm has been established for nearly a century. Those interested should write for Catalogue 25; the price is 2s. (post free), which amount is returned on the first order of 10s.

An Asbestos Primer.

We understand that difficulty has been experienced amongst builders and decorators in obtaining a satisfactory primer over the various types of asbestos sheeting. The main difficulty has been with oil and water paints flaking off after a time and leaving the sheeting quite bare. Messrs. John Smith & Son, Ltd., have been experimenting with a special primer, which they have called Asbestos. A large firm of builders has recently carried out extensive tests with Asbestos, and we understand that their report more than justifies the firm's claims, in that it adheres to the sheeting, and will not flake off or cause the paint applied over it to flake. Asbestos dries in about fifteen minutes and is easily applied. Full particulars and prices will be sent on application to the firm's City offices, at 23, Leadenhall-street, E.C. 3.

Roofing Materials.

We have received from Messrs. Bell's Poilite and Everite Co., Ltd., an attractive album entitled "Permanence Without Maintenance." This publication illustrates roofing contracts carried out all over the world by these well-known manufacturers of asbestos cement materials. The first part of the album is devoted to illustrations of roofs of factories and similar buildings covered with Everite corrugated sheeting, the Bigsix type of which the makers claim to be extremely strong, and thus allowing of wide spacing of purlins effects a considerable saving in substructure. In the second part of the book appear some illustrations of roofs covered with Poilite pantiles and Poilite straight cover slates; in these Messrs. Bell & Co. have succeeded in producing asbestos cement in a really artistic form. These tiles impart to the buildings illustrated a quiet charm and distinction.

A NOVEL LECTURE SCHEME

THE allied firms of Robt. Ingham Clark & Co. and R. Gay & Co. carried out recently at their works, West Ham Abbey, Stratford, a programme of lectures and practical demonstrations in regard to the manufacture of varnishes, enamel, distempers and other products of the two houses. The scheme was specially designed for the benefit of salesmen of builders' and decorators' merchants who stock the goods of the two firms. More than sixty salesmen were present at the whole, or a portion, of the proceedings which occupied three days, from Monday to Wednesday, December 7-9. Mr. F. W. Fell Clark (chairman of Robt. Ingham Clark & Co., Ltd.), presided at the opening session, Major R. H. Ingham Clark and Mr. R. F. Clark taking the chair at the subsequent meetings.

The Chairman gave a short resume of the history of the firm, which, he stated, was founded in 1846, and had arisen from a very small concern to one with branches in Renfrew, Paris, Barcelona, Milan, New York, Buffalo, Chicago, Bridgeburg (Canada), and Sydney. The works at West Ham covered about 6 or 7 acres of ground and were organised and equipped with the most modern methods for the production of highest grade materials. In addition to the manufacturing of varnish, something like 60 mills were employed in the grinding of enamel and paint. Although they had large works scattered all over the world, and carrying on a large volume of trade in the various countries, they had maintained and even increased their output at West Ham. This had been due in great part to the energy displayed on the selling side. In this respect they had learnt something from their American House, which was represented by 210 salesmen. It had been their policy to send some of their younger men over there to study the methods and especially sales organisation which had made that house the success it was. The sales policy adopted by their American house

was to work the whole of their business through the merchant, or, as it was termed over there through dealers and jobbers. That was the system which they would like adopted here because they considered the manufacturer's business was to supply the merchant and the business of the merchant to distribute the goods.

During the three days a number of lectures were given by representatives of the associated houses on a variety of aspects of the industry. These included lectures on varnishes, enamel, stains, raw materials, salesmanship, advertising and so forth. The visitors were conducted around the works and the plant and processes of manufacture were fully explained.

On Wednesday evening the visitors were entertained to a banquet at the Trocadero, Piccadilly. The chair was occupied by Mr. F. W. Fell Clark who was supported by directors of the allied houses. After the loyal toast had been honoured, Mr. R. H. Ingham Clark, submitting the toast of "Our Guests," said the modern wholesale distributor was a most necessary part of the commercial organisation of this country. It had been often put forward that the middleman was not a good thing in business. People said that manufacturers should sell direct to the consumer. That was absolutely wrong. The wholesale distributor was the only means of economic distribution.

Mr. C. H. Ellison, of Ashworth, Armitage, Ellison, Ltd., of Birmingham, and Mr. H. Glover, of Messrs. H. S. Hiles & Co., of Manchester, replied.

The toast of the Associated Houses was proposed by Mr. John Olby (A. Olby, Ltd., Ramsgate).

In responding, Mr. F. W. Fell Clark said he felt very proud to have such an organisation and such a staff around him. They hoped this new plan would become the big success that it ought to be. For the merchants to disappear must be the most uneconomical way of doing business.

Mr. R. F. Clark, in proposing the toast of "The Press," referred to the National Society for the Preservation of Property, to which manufacturers were subscribing. It was a Society for the benefit of the whole trade. It would benefit the whole Empire and the whole United Kingdom for it was the object of the Society to teach people how and when to use paint.

Mr. Genner, Organising Secretary and Manager of the N.S.P.P., said they issued their first invitations to membership of the Society rather less than four months ago and the result to date was approximately 250 members—a good solid start. The Society was now in a safe position for the next three years, for they had collected contracts totalling £5,600 per annum for the next three years.

The toast was acknowledged by Mr. G. J. Howling, of *The Builder*.

"The Builder" Diary.

The Builder pocket diary for 1926 is now on sale and may be obtained from 4, Catherine street, Aldwych, W.C.2, price 2s. 6d. (2s. 9d. post free). In addition to a well-arranged diary memoranda, and cash account columns, there are 53 pages of notes and tables calculated to be of practical use to architects and builders in their daily work. Details are given of architectural, surveying and building societies, institutions and schools. Very useful information is afforded by the tabulated articles on the building trades, each of which is dealt with in a clear and concise way. Another indispensable item is the table giving the new British Standard Sections of steelwork. Under the title of "Mensuration Notes" ratios are given to enable one to find the area or volume of any geometrical body of which the measurements are known. The page on fire insurance should prove useful, as should also the valuers' table for purchasing leases; other tables include one giving the area of circles, in inches, feet or yards, given the diameter; the decimal equivalents of a foot and an inch; the decimal equivalents to falls in pipes; the scaling of roof timbers; the safe distributed load in cwt., over 1 ft. span for fir beams; the weight of various metals, and the weight in lb. per lineal foot of square and round steel. All these items are set out in a compact form and catalogued in a simple index.

The Abbey Langthorne War Memorial.

[A war memorial erected by the Abbey Langthorne Comrades of the Great War, and subscribed for by members of the allied firms of Messrs. Ingham Clark & Co., Ltd., Messrs. R. Gay & Co., Ltd., and Messrs. the Mitcham Japan and Varnish Co., Ltd., was unveiled recently after a short service. The memorial consists of a 6 ft. Portland stone cenotaph to which is affixed a brass plate bearing the names of the fallen.]

ROAD CORRUGATION

We give hereunder a report of a paper on the above subject read at the Public Works Congress recently held at the Agricultural Hall, Islington.

Mr. E. L. Leeming, M.Sc.Tech., Soc.M.Inst.C.E., said that with the advent of improved road construction and of motor transport there had developed a curious feature wear which was generally known amongst road engineers as "road corrugation." This consisted on sett paving as well as tar macadam in conditions were severe and the paving was not laid on a concrete foundation. Where concrete setts were laid on concrete to cope with exceptionally heavy traffic the setts could be easily move either vertically or horizontally, and if two lanes of traffic existed ruts would be worn in the setts themselves. Road blocks often became wavy, and yet one could find such paving under heavy traffic comparatively free from it.

The motor-bus was a vehicle driven from the front axle and usually equipped with solid rubber tyres, a combination which inflicted considerable damage to the road. The rear-axle drive was perfect only so long as the road was perfectly smooth, but even the best road did not possess this smoothness, with the result that vibration due to the drive was set up, and this vibration created waves in the road, and the solid rubber tyre, quickly, shorn of its resilience by pressure and wear, was incapable of taking up these road inequalities, and made the journey worse.

The road engineer would testify to the increased expenditure incurred at the bends of the road; the road user would testify to the rough surface, potholes and waves which he had to negotiate at curves. There was one remedy for this state of things, and that was to construct the surface levels so that there was a gradual change from the cambered section on the straight to a super-elevated section on the curve. Roads repeatedly tarred and often worked up into waves independently of the original surface; in such cases surfacing would remove the trouble. Large quantities of tar macadam would resist movement better than small aggregate; finishing coats of the tar-mac should be applied sparingly so that it did not leave surplus material without proper key. Bituminous asphalt about 2 in. thick when laid on concrete withstood wear and tear with great success. In regard to construction generally, it was clearly necessary to have thoroughly strong foundations. The suggestions for reducing vehicle damage might be confined to (a) tyre equipment and (b) method of drive. Regarding tyre equipment, solid rubber tyres should be more heavily taxed; in other words, taxed more nearly in proportion to the damage done. A pneumatic tyre was a most efficient spring or cushion and "unsprung weight" was eliminated. If front-axle driving were combined with pneumatic tyre equipment wave damage would be reduced to a minimum. If pneumatic tyres were not to become universal, then some improvement on the present rear-axle drive would be necessary. Actually it would lessen vibration considerably if the load could be pushed from the front axle instead of pushed from the rear. Six-wheel vehicles were a step in the right direction, and particularly those which provided four driving wheels.

New Highway, Bolton.

Forming part of a scheme devised by Bolton Corporation for the relief of unemployment, a new highway, 50 ft. wide and two miles long, leading from Astley Bridge to Breighmet, is now under construction. The road is to be the second section of a circular route which ultimately will be built round the town. Three bridges will be required, and these will be of steel. Messrs. John Booth & Sons, Ltd., Bolton, are carrying out the whole of the work under the direction of the Borough Engineer, Mr. E. L. Morgan, O.B.E., A.M.I.C.E., and Messrs. C. S. Elliot & Son, Manchester.

(For rates of wages in the Building Trade in Scotland, see page 91.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

MANCHESTER.—A definite scheme is being launched for erecting permanent church and school premises at an approximate estimate of £7,500, for the Congregational Church Committee, at Moss Side.

MARGATE.—The Corporation are to construct, at a cost of £1,000, an improved approach to the Westbrook pavilion.

MORECAMBE.—The Borough Engineer has prepared plans for the erection of an omnibus shed in Clark-street. A scheme is to be prepared for the establishment of a market on the Poulton Hall estate. The Borough Engineer is to prepare plans for rebuilding the slaughter-houses. The Borough Engineer has pre-

pared plans for a shelter to be erected in Torrisholme Park. In connection with the proposal for the construction of a bathing pool, it is being suggested that in connection with the scheme plans should also be prepared for a concert or floral hall.

NEAR WEST KIRBY.—Caldy Grange Grammar School, near West Kirby, is to be extended at an early date.

NEWCASTLE.—The Town Surveyor of the U.D.C. submitted plans of swimming ponds and provision for hot-water baths on the north side of the Blackrock, the cost being estimated at £4,731. A new bridge is to be erected on the Tullybrannigan road, at a cost of £120.

NEWPORT PAGNELL.—The U.D.C. has approved plans for the erection of a new building for the Newport Pagnell Co-operative Society, in the High-street.

NEWRY.—The U.D.C. has approved a report and estimate for the proposed municipal electricity scheme, at £17,500.

NORTH DUBLIN.—The R.D.C. has adopted a new scheme for 98 cottages, at an estimated cost of £40,120.

NOTTINGHAM.—The County Cricket Club Committee are proposing to provide additional accommodation at the cricket ground at Trent Bridge, estimated to cost £8,000.

OMAGH.—The U.D.C. has decided to erect four blocks of semi-detached houses on the Dublin-road site, at a cost of about £680 each. The engineer has been instructed to prepare the plans.

OSSETT.—The B.E. has approved the plans for the extensions at Ossett Grammar School.

OTLEY.—The U.D.C. has asked the surveyor to prepare a reconstruction scheme for property in insanitary areas. Plans of the surveyor for band stand, convenience, shelter, &c., at Wharfmeadows, at a cost of £2,000, have been agreed to.

PENRYNDEUDRAETH.—Merioneth C.C. are seeking the consent of the Home Office to purchase the market hall for £600 for police purposes.

PENZANCE.—The Borough Engineer has prepared plans for improved lavatory accommodation on the promenade, at a cost of £500. Plans are to be prepared for the provision of additional accommodation at the cattle market by using part of the old reservoir site.

PETERBOROUGH.—The R.D.C.'s second section of the housing scheme comprised: Castor, 12 houses; Northborough, 12; Glington, 8; Maxey, 4; Etton, 4; Fengate, 14.

PLYMOUTH.—The C.B. recommend that application be made to the M.H. for sanction to borrow £11,291 for the erection of 24 flats for housing of the working classes at Pottery Quay.

PONTEFRAC.—The Yorkshire Electric Power Co., Ltd., are to erect a new electricity sub-station at Carleton Green, within the R.D.C. area.

PRESTWICH.—Mr. J. Eastwood is to erect 13 houses on the Greengate Park estate. The surveyor is to prepare a lay-out plan for houses on land at Bent Meadow. Part of the Rectory estate is to be purchased for a housing scheme.

PRUDHOE.—The U.D.C. has decided to erect 112 semi-detached houses on the Prudhoe Castle estate.

SANDERSTEAD.—Coulson and Purley U.D.C. has given consent to Messrs. Richard Costain & Sons, Ltd., to develop Addington-road, Sanderstead, as a shopping area.

SHEFFIELD.—The members of the Blackburn Wesleyan Church, Ellesmere-road, are proposing building a new Sunday school.

SHEPHEL.—The U.D.C. are to make application to the M.H. for sanction to borrow £1,130 for the purchase of land in Charnwood-road and Spring-lane as a site for the erection of working-class dwellings.

SHIPLEY (YORKS.).—The U.D.C. has approved plans for the lay-out of the Wood End estate and Pudding Hall estate, upon which it is proposed to erect 280 houses.

SAREWSBURY.—The R.D.C. decided to make application to the Ministry of Health for sanction to borrow £19,000 for a sewerage scheme at Harlescott. Plans were passed of houses to be erected by the Chatwood Safe Co., who are removing their works from Bolton to Harlescott.

STOKE-ON-TRENT.—Strong opposition to town-planning proposals by the Corporation was offered by the Chatterley-Whitfield Colliery Co. at a M.H. inquiry.

SUNDERLAND.—An inquiry has been held by the M.H. into the application of the Corporation for sanction to borrow £18,000 for the purpose of building a retaining wall under the cliffs of the Cliff Park, Roker.

SWANSEA.—Plans for the erection of new business premises at 1 & 2, Cambrian-place have been prepared. The joint architects are Messrs. Romaine-Walker & Jenkins, 6, Old Bond-street, W. 1, and Mr. E. R. Griffiths, 12, College-street, Swansea.

TANFELD.—The U.D.C. is seeking permission to erect a further 45 houses.

TRURO.—Sanction has been given for a further loan of £4,000 in connection with the conversion of market buildings into a civic hall. The Anglo-American Oil Co. have prepared plans for the proposed depot at the junction of Station Hill and Treway-road.

WALTON-ON-THAMES.—The U.D.C. recommended that Mr. Carvill be instructed to prepare sketch plans showing the lay-out for a further 50 houses of three-bedroom non-parlour type.

WAXDSWORTH.—The B.C. has received from the L.C.C. sanction for the borrowing of the loan of £94,800 for the erection of 16 houses on the Furzedown Housing estate. Application is to be made for sanction to borrow the following: Streatham Bath, erection of superstructure, additional cost, £3,600; Earlsfield Library, furniture and erection of building, £2,000.

The B.C. passed plans: Collett Building Co., Ltd., 34 houses on site bounded by Poynders-road, Clarence-road and Atkins-road, Clapham South; Wates, Ltd., (a) 24 houses in Bridgwood-avenue, Streatham, and (b) 11 houses, Glenister Park-road, Streatham, and four shops, Streatham-vale; F. J. Jee, nine lock-up garages, Viborg-yard, Danemere-street, Putney; R. Kendall, Ltd., 10 houses, Kingsmead-road, Streatham; F. Smith & Co. (Builders), Ltd., printing works, Edgeley-road, Clapham North; H. A. Smith, 18 houses, Atkins-road, Clapham South; R. H. Miller & Son, Ltd., 19 houses, Streatham-vale, 42 houses, Braeside-road, 32 houses, Abercain-road, 20 houses, Cannore-gardens, and 22 houses, Donnybrook-road, Streatham.

WARWICK.—Messrs. F. P. Trepess & Son, architects, have prepared plans for the extension of the hall at Myton School. Mr. Trepess has prepared plans for 60 parlour and non-parlour houses to be erected in All Saints'-road.

WEYMOUTH.—The Borough Surveyor submitted plans and alternative estimates for the provision of a new bowling pavilion at the Melcombe Regis gardens, and the T.C. recommended to approve the scheme providing for a new bowling pavilion with bowls room and caretaker's room, at an estimated cost of £600, and to instruct the Borough Surveyor to invite tenders for the work. The Corporation are arranging for the purchase of eighteen acres for the erection of 200 houses. A bowling pavilion is to be erected at Melcombe Regis Gardens, at a cost of £600, in accordance with plans prepared by the Borough Engineer. Extensions are proposed at the generating station at a cost of £75,000.

WILLINGTON (CO. DURHAM).—The U.D.C. has obtained sanction from the M.H. to erect an additional 30 houses by direct labour at a cost not to exceed £390 per house.

WOLVERHAMPTON.—The Corporation are considering an important scheme relating to the widening of Green-lane, Dudley-street, and Market-street, and the construction of a new road of 60 ft. average width across the Rough Hill, from Thompson-avenue to Willenhall-road. The scheme will entail the widening of two bridges and the construction of a new one. The cost of the new road and bridges is estimated at £41,740. The scheme for the transfer of the electricity generating station, &c., to the West Midland authority for £379,500 has been recommended for adoption by the Electricity Committee.

WORKSOP.—The R.D.C. has passed plans for the erection of 358 additional houses, including two shops, at Langold, in connection with the new Firbeck Main Colliery, near Worksop.

YARMOUTH.—Twelve tenders were accepted for the erection of 98 houses on the Barracks estate. For blocks of eight the prices ranged from £3,312 to £3,360. A loan of £40,500 is to be applied for.

YIEWSLEY.—The U.D.C. has approved plans for the chapel at Padcroft Boys' Home.

FIRE.

COATBRIDGE.—Damage believed to be between £9,000 and £10,000 has been done by an outbreak of fire in Whifflet Foundry, Coatbridge.

Mersey Tunnel.

Messrs. Edmund Nuttall, Sons & Co., Ltd., engineering contractors, of Trafford Park, Manchester, have obtained the contract for sinking two preliminary shafts and boring two headings under the Mersey in connection with the Mersey Tunnel scheme. Their tender was for £443,079, and they are to complete the work in twenty-five months. The two headings, or advance borings, will each be 15 ft. by 12 ft. in diameter, and will run one above the other. They will be widened eventually to form the complete tunnel, which is to be 44 ft. in diameter. The two shafts will be sunk simultaneously, one on each side of the river, at Liverpool and Birkenhead.

Portsmouth Road Schemes.

Portsmouth Borough Council have decided to float a loan of £750,000 for public works, including the remaking of roads and bridges and the building of new schools.

Fireproof Building in Canada.

The High Commissioner for Canada reports that Montreal will shortly have an industrial property valued at nearly a million dollars, on which not a cent. of fire insurance will be placed, as a result of confidence in the absolute invulnerability to fire of the material used in the construction of the property. The Ontario Gypsum Co., Ltd., started the construction of their branch in Montreal East last July. One of the buildings is 705 ft. long; the other, 160 ft. long, the latter being 40 ft. high and two stories, and the former, one story. The material used for the construction, namely gypsum, has been shown to be absolutely fire-proof. It was stated that an attempt to burn a gypsum building down in Toronto had failed. Products of the plant will be Gypso wall board, wall plasters of all kinds, as well as plaster of Paris, also Insulex, which is used in wall construction. Raw materials used in the manufacture of the products are to be brought from Nova Scotia. Ontario, which already has four plants of the company, produces the raw material within its own provincial borders.

Death of Mr. Harry Margrie.

The death has occurred at the age of 57, of Mr. Harry Margrie, of the firm of Margrie & Son, builders and decorators, Camberwell.

THE SCOTTISH BUILDER
NEW BUILDINGS IN SCOTLAND

Elgin.—BATHS.—The Town Council has instructed the burgh surveyor to prepare a site plan for the erection of public baths on a site at North Lodge.

Hawick.—HOUSES.—The Public Health Committee has received from the Burgh Surveyor lay-out plans for eleven blocks of three-roomed houses, eight blocks of two-roomed houses, three blocks of three-roomed houses, and three blocks of two-roomed houses—a total of 100 houses. The Town Council has recommended that this scheme be proceeded with at once.

Airdrie.—HOUSES.—The Airdrie Town Council has accepted, subject to the approval of the Board of Health, offers for an instalment of 32 four-apartment cottage houses at the Cairn-hill site. The average costs work out at £487 7s. 7d. per house. Offers were also accepted for erecting 28 slum clearance houses on the Chapelside site. These are estimated at £.96 per house.

Causewayend.—GYMNASIUM.—The Aberdeen E.C. propose to build a new gymnasium at Causewayend School.

Aberdeen.—ROAD.—The Aberdeen Town Council has adopted the report of the Streets and Roads Committee on the proposed outer ring road round the city from the Bridge of Dee to Great Northern Road, which is to be constructed at a cost of £140,500.

Torry.—SCHOOL.—The Finance, Law, and General Purposes Committee of the Aberdeen E.C. has approved of the final plans of Torry Intermediate School.

Kintore.—HOUSES.—The Town Council agreed to appeal to the Board of Health for the necessary permit to build three blocks of houses, each block for four tenants.

Glasgow.—HOUSES.—The Town Council approved the recommendation of the Sub-Committee on Sites and Buildings that an order for 500 three-apartment houses, half in concrete blocks and half in terrazzo blocks, to be erected at Govanhill, Lochburn, Maryhill, and at

Knightswood, be given to the Balshagray Building Company, subject to the adjustment of the details of the Company's offer.—The Council approved the reconstruction of Kelvin Hall, in connection with the amended lay-out plans submitted by the City Engineer. The acceptance of the offer, amounting to £162,115, exclusive of heating and lighting, and the design by Sir William Arrol & Co., Ltd., were also approved.

St. Giles' Christian Mission.

Founded in 1860 in the centre of London's slums, St. Giles' Christian Mission has for sixty-five years been in daily touch with the wants and woes of the poorest of the poor. Christmas dinners are distributed to deserving families every year, coals and blankets given in poverty-stricken homes, and toys and winter treats provided for the little ones. Such a work carried on day by day all the year round needs constant and liberal support, and further particulars can be obtained from Mr. William Wheatley, 4, Ampton-street, Gray's Inn-road, London, W.C.1, to whom all contributions should be addressed.

Mersey Tunnel Contract.

The first contract for the £5,000,000 Mersey tunnel scheme has been placed by the Mersey Tunnel Joint Committee with Messrs. Edmund Nuttall, Sons & Co., Ltd., a Manchester firm of engineers. The contract is for the preliminary sinking of shafts and erection of headings. The amount of Messrs. Nuttall's tender was £443,079. The work is to be completed in 25 months.

South Yorkshire Architects.

We have received the thirty-seventh annual report of the Sheffield, South Yorkshire and District Society of Architects and Surveyors. A very successful year is recorded, under the presidency of Mr. H. L. Paterson, F.R.I.B.A. We notice that Rotherham Bridge, one of the few ancient bridges with a chantry chapel, was threatened with demolition to make way for a new bridge during the year, and mainly owing to the representations made to the Ancient Monuments Department of the Office of Works by the Society it has been saved.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.
Aberdeen	1/8	1/8½	1/8	1/8	1/8	1/8	1/7	10½d. to 1/1

DECEMBER 25, 1925

DILAPIDATIONS AND WASTE

THE law relating to dilapidations and waste, although somewhat intricate in its more minute details, is a subject which the energetic architect or surveyor of to-day recognises as of the utmost importance, and as calling for his personal and serious study. Truly, there are still those who confidently assert that they are satisfied to rely on the exercise of common sense when called on to deal with any claim for dilapidations, either in preparing the claim, checking it, or opposing it.

However, there is a growing tendency to regard the architect or surveyor as having a responsibility to foresee and, as far as possible, provide against dispute in connection with work entrusted to his supervision; and the exercise of common sense (in this as in many other matters where there is any intricacy where one, or both, of the parties is inclined to stand on his rights), likely to pave the way for, rather than to avoid, difficulties. Recent measures, such as the Housing of the Working-Class Acts, the Housing and Town-planning Acts, and the Rents Restrictions Acts, have introduced new definitions of the respective liabilities of landlord and tenant; and in cases where any of the provisions of these Acts may apply, exact knowledge is the only safe guide.

It may be said that the law relating to dilapidations is at present very much in the making, and there are many of our readers and others whose practical or professional work is affected, who would welcome more exact definitions than it is now possible to tabulate from a comparison of the rulings in recent cases.

It is clear that an architect or surveyor who is commissioned to draft the repairing covenants of a lease should be able to formulate the clauses thereof in lucid and unambiguous terms, and in the accepted phraseology of existing Acts, so as to prevent misunderstanding between the parties, or disappointment to either of them.

Familiarity with the laws in operation is yet more essential when he is commissioned to oppose or settle a claim based on any schedule of dilapidations under an existing covenant, express or implied; or to deal with such a claim where there is no particular covenant. He must be able to give full weight to each word of the written covenant in conformity with the Acts, and to bring his knowledge of general principles of law to bear on an unwritten or implied covenant. Also he may be asked to prepare a dilapidation survey report on an old building, for the purpose of putting on record its condition, so as to define the liability of the landlord and tenant as to repairs, prior to the signing of a new lease or the renewal of an existing one.

In Scotland and in Ireland, the laws differ in details, and although corresponding for the most part with those operating in England, appear on the whole to be more favourable to the tenant than the landlord.

The Ecclesiastical Dilapidations Act of 1871 and the more recent Act—the Ecclesiastical Dilapidations Measure of 1923—set

forth extensively the principles controlling the settlement of claims for dilapidations in Church properties; and these principles diverge considerably at times from those applied to the control of lay property.

At present, as a matter of fact, there is very little specific statutory law of lay dilapidations, excepting the clauses, when applicable, which occur in the Housing of the Working-Class Acts, the Town-Planning Acts and the Rents Restrictions Acts above referred to, and therefore it is all-important that all leases should contain unambiguous repairing covenants. Since 1890 the case of *Proudfoot v. Hart* was the accepted guide and precedent in the vast majority of cases; but in 1924 the decision in *Calthorpe v. McOscar*, considerably modified the law, and distinguished between the cases which were thereafter to be ruled by the one or the other of these cases.

Not infrequently the so-called dilapidation survey report of some practitioners is nothing more than an ordinary specification of works which, it is claimed, should be carried out in order to put the property surveyed in a suitable condition of repair, and no account is taken of the legal liabilities of the parties as defined by the nature of the covenant existing between them; or, where there is no covenant, the general principles of law are similarly disregarded.

Having considered these circumstances, we have concluded that it will be of interest to our readers—and certainly to all interested in the management of property—to hear that we intend in the New Year to begin the publication of a series of articles on this subject. The articles will endeavour to present the matter in a lucid manner with the minimum of legal technicality consistent with concise explanation, in order that the articles may be of practical use to the busy man, and, we hope, on occasions save time which he would otherwise spend in searching for guidance through exhaustive treatises written by lawyers for the use of lawyers—most of which are admirable as such—though not of practical use to the practising architect or surveyor.

The articles will also deal shortly with the Ecclesiastical Dilapidations Acts and the Ecclesiastical Dilapidations Measure; the various Acts, and the general principles of law operating in the interpretation of covenants of different natures in regard to lay dilapidations; the modifications of these laws in respect of various classes of property; fixtures; the liability of a tenant for life, a mortgagor and a mortgagee respectively; and the effect on the covenants of bankruptcy of one party; dilapidations in dangerous structures and in party walls and party fence walls; and many other minutiae of practical interest to our readers. The articles, the first of which will appear in our New Year double number, to be published on January 8, have been written by Mr. W. T. Creswell, Lic.R.I.B.A., Barrister-at-Law, whose articles in *The Builder* on "The Law Relating to Building" and "Arbitration in Building Disputes" will be remembered.

NOTES.

Waterloo Bridge.

If there is one feature which gives to London some real distinction as a city it is the combined effect of Somerset House and Waterloo Bridge, which form together a group of architectural value hardly to be excelled the world over. The two structures could hardly have been more harmonious and impressive had they been designed by the same hand. Looking over these and the fine line of embankment in the foreground, we see the dominant mass of St. Paul's and numberless other city churches giving charming points of distinction to the city view; amidst all the change and spoliation which is everywhere going on, this view at least is a source of continual pleasure and charm. Now, whilst we are lamenting the loss of a Regent-street which in simple dignity was one of the finest streets in the world, we are threatened with the spoliation of what is probably the one chief note of distinction in London. We do not think it is right that such a fate should be permitted by the Government of our nation.

City Development.

We protest that the fate of Waterloo Bridge should be judged as a thing apart from the general scheme of City development, of roads and bridges, and town planning generally. How can the future of London be rightly envisaged until the future of railways and tramways has been properly considered and provided for? Whether an increased volume of traffic over Waterloo Bridge is desirable or not—whether we are going to have a new bridge both east and west of it—whether the south side of the Thames is ever to have its roads and building spaces properly adjusted—whether we are really going to prevent the erection of any sort of building anywhere and for any purpose—whether we are determined to insist on something like law and order in the growth of London—these are questions which come in the forefront

of everything and demand the consideration of practical councillors. If Waterloo Bridge goes it will be an everlasting slur on the intelligence of our administration to-day, which can not only destroy a great work of art but is unable or unwilling to face the greater problem of city development and plan of which the bridge is only a part.

London Bridges.

THE reason why the record of our London bridges is one of failure and incompetence is because we have suffered from the same isolated standpoint which still actuates our councillors. Is there no one of courage and influence who can inspire our authorities with broader and finer ideals? The London Society was founded for this express purpose. Perhaps it might show a little light on our difficult and troublesome path.

Intellectual Opinion.

Is it not somewhat extraordinary that numbers of the cultured and intellectual public can accept the possible destruction of Waterloo Bridge with favour or at least with indifference, whilst at the same time they do feel a

certain sympathy with artistic ideals in a variety of other directions? We cannot but think that the indifference to the art of architecture is due to the lack of guiding influences which are so rarely exerted by those who do know and appreciate the importance of architectural art. We believe everyone is influenced by the buildings which are part of our daily life and vision, but this influence is largely subconscious, and its reality has little force when issues like those of Waterloo Bridge are presented. Amongst the many protests which have been raised, we feel nothing has touched quite so high a level as Professor Beresford Pite's letter, which we print to-day. Amongst many suggestions for the alleviation of the situation, there is, perhaps, something to be said for the adoption of Waterloo Bridge as an avenue for exclusively pedestrian traffic, which would save one of our most cherished and dignified possessions.

ON behalf of the building trade unions, opposition is aroused against the Government's decision to erect

Steel Houses for Scotland.

2,000 houses of the Weir type in Scotland. The old question of engineers' wages is again to the fore, and the claim is advanced that engineers employed in the work of housing should receive the same wages as building trade operatives, in lieu of the lower rates payable to them as engineers. Apart from the relative merits of brick, steel and concrete houses, we fail to see why engineers, when doing engineers' work, whether in connection with housing or anything else, should be paid higher wages than those with which they are ordinarily satisfied. As has been stated by employers, if the conditions demanded by the building trade unions were granted, it would mean that two sets of men working in an engineering shop would be receiving different rates of pay. This would certainly cause discontent amongst the engineers, and might lead to further disputes.

Old Half-Timber House, Chartham, Kent.

House of the late Lord Milner, Sturry.

The Dignity on the Lambeth Borough Council's housing estate at Gipsy Hill are reported to

have struck work as a protest against a statement by Alderman Edward Rice to the effect that each bricklayer takes one minute and twelve seconds to lay a single brick. It is somewhat refreshing to learn that the men resented this statement as conveying an imputation of dishonesty in restricting output, and that the motive of the strike was the vindication of their dignity. According to Alderman Rice, one of these workers would lay 50 bricks in an hour or 400 in an eight-hours' day, and if their actual performance exceeds this amount it is all to the good.

The Royal Sanitary Institute.

THE Royal Sanitary Institute, which has been working for fifty years in the cause of public health, will celebrate its jubilee by holding an Imperial Congress in London next year, from July 5 to 10. The Right Hon. Neville Chamberlain, M.P. (Minister of Health), has accepted the Presidentship of the Congress. The Congresses held by the Institute during the past fifty years have given opportunities for representatives and officers of sanitary authorities to meet and discuss the many problems

that arise in the public health administration of the country, and have also dealt with subjects of a Colonial and international interest. These meetings are of great value in stimulating public health work, and are much appreciated by members of sanitary authorities and the officers engaged in public health administration. The Lord Mayor and Corporation of the City of London are co-operating in the Congress by granting the use of the Guildhall for the opening meeting.

An Experiment in Smokeless Houses.

ANOTHER experiment is about to be made for the abatement of smoke in domestic buildings. A scheme is being prepared by the City Engineer of Leeds for nearly a hundred houses to be fitted with only gas or electricity for all heating and lighting purposes. If the experiment proves successful, future housing schemes will provide all gas, or all electricity, for streets and houses alike. The concession of one open fire for kitchen purposes is, we are told, being made for the present scheme. Should this mean more sunshine and less fog, improvement both to the health and spirits of the inhabitants should result as the method extends itself, and the buildings of our industrial cities will suffer less defacement. Leeds Town Hall, now almost black, gives

Brick Chimney Stack at Wye.

startling witness to the disastrous effect arising through smoke pollution. If the factory, in addition to the domestic house, would adopt these more sensible and hygienic methods the benefits to our cities would be almost incalculable.

Glass from Wells Cathedral.

THE overhauling of the stained glass at Wells Cathedral has given an opportunity for exhibiting in London, for a short period, two representative specimens of the glass, which have been lent for the purpose to the Victoria and Albert Museum by the Dean and Chapter. These are a panel with a figure of a trumpeting angel, which must at one time have formed part of a "Last Judgment," from the Lady Chapel, and a round of grisaille glass from the tracery of one of the windows on the Chapter House staircase. Both are good examples of English glass-painting of the first half of the fourteenth century. They will remain on view for a few weeks in Room 110 on the first floor of the Museum.

R.A. Gold Medal Sculpture.

WE illustrate on this page the sculpture group "Jacob Wrestling with an Angel," by Miss Eva D. Allan, which has been awarded the R.A. Gold Medal and Edward Stott Travelling Studentship. The group is inspired by Genesis xxxii, and represents the conflict between the spirit and the flesh. The author of this spirited group entered the R.A. Schools in December, 1922. She won both the Landseer Scholarship and Silver Medal in 1923, two silver medals in 1924, and was selected as one of the four finalists in the Prix de Rome Competition in 1925.

Jacob Wrestling with an Angel.

By MISS EVA D. ALLAN (Sculpture Group awarded R.A. Gold Medal and Edward Stott Travelling Studentship).

GENERAL NEWS

Change of Address.

Mr. R. Langton Cole, F.R.I.B.A., is retiring from the Stock Exchange on December 31. After that date, correspondence relating to those premises should be addressed to Mr. G. J. Buckingham, Surveyor of Works, at 23, Throgmorton-street, E.C. 2. Mr. Cole's address will be Abbey House, Westminster, S.W. 1. Telephone number, Victoria 6678.

Proposed Kingston Hospital Scheme.

The Kingston Board of Guardians propose the extension of Kingston and District Hospital and the addition of a nurses' home, at a cost of £100,000.

Grecian Alabaster Exhibit.

The Greek and Roman Department of the British Museum will exhibit next week a piece of Grecian alabaster representing six horsemen riding to pay homage at a shrine where a sheep is being sacrificed. The date of the work is estimated at between 600 and 500 B.C.

Mobberley Mount Everest Memorial.

A stained glass window is to be placed in Mobberley parish church to the memory of Mr. George Leigh-Mallory, who lost his life in the Mount Everest expedition.

Birmingham Art Gift.

Mr. J. A. Kenrick, of Birmingham, has given seventy-two water-colours by David Cox to the City Gallery.

Restoration of a Chantry Chapel.

The Chantry Chapel in Winchester Cathedral, built to the memory of Bishop Richard Foxe, the founder of Corpus Christi College, Oxford, has recently been restored in appearance to that of Nash's drawing, once in the possession of Dean Stephens. Instead of being solely a place to be gazed at by tourists, it is now used as a place for preparation for Holy Communion.

Sheffield City Architect.

Sixty-four candidates applied for the position of City Architect to Sheffield, at a salary of £1,000 per year, on the retirement of Mr. F. E. P. Edwards, who held the post for seventeen years.

Proposed Channel Island Church.

The Bishop of Portsmouth proposes to build a church to accommodate 300 on the island of Alderney, in the Channel Islands. Plans are being prepared by Messrs. J. H. & W. C. Mangan, architects, of 18, Guildhall-street, Preston.

A Rubens Discovered.

In an unfrequented landing of Cole Orton Hall, near Ashby-de-la-Zouch, has been found a portrait asserted to be by Rubens, and to be a better example of his work than is possessed by the National Gallery. The picture has been insured for £25,000.

Welsh National Museum.

The National Museum of Wales, Cathays Park, Cardiff, are appealing for £100,000 in order to complete the present structure.

University College.

University College, Gower-street, is appealing for £500,000 for extensions.

London Hospital Extension.

The Hospital for Diseases of the Throat, Golden-square, W., which, except for its out-patient department, has been closed for two years for reconstruction and extension, was reopened recently. Mr. Harold Goslett was the architect.

Architect's Estate.

Mr. Edgar Cronk, architect, of St. John's-road, Tunbridge Wells, left gross estate of 13,861.

Mr. James Jerman, architect, of "Coomroye," Topsham-road Exeter, has left net estate of £2,727.

COMPETITION NEWS

The Council of the Institution of Heating and Ventilating Engineers offer the following prizes for original papers on subjects connected with heating and ventilating, during 1926:—Lumby premium, £10 10s.; Sirocco premium, £10 10s.; London premium, £5 5s. The winning of an award may carry with it a medal of the Institution. The prizes will be awarded as follows:—The Lumby Premium for the best paper dealing with, or any subject connected with heating or hot water supplies. The Sirocco Premium for the best paper dealing with ventilation and the general application of fans; air washing, air conditioning, dust and fume removal, mechanical draught, &c. The London Premium for the next best paper on any subject included in the above. Competitors must be either students attending a technical institute or assistants actively connected with the business or profession of heating and ventilating in Great Britain and Ireland, and not principals or employers. Papers to be posted to Competition Committee, c.o. the Secretary of the Institution of Heating and Ventilating Engineers, not later than May 1, 1926.

Pleasure Buildings, Aberdeen.

Aberdeen Town Council propose to invite competitive designs for a dancing hall, restaurant, variety pavilion, and shops to be built at the Beach, with provision for a concert hall (not yet to be proceeded with), at a cost of £20,000. Premiums of 100 guineas and 50 guineas are to be awarded. The President of the Incorporation of Architects in Scotland will act as assessor.

Colombo Kochchikadde Slum Scheme.

The design of Messrs. Booty & Edwards, F.R.I.B.A., has been placed first in this competition.

Australian National War Memorial, Villers Bretonneux, France.

Designs are invited for the Australian National War Memorial to be erected at Villers Bretonneux, France. The competition is limited to (a) Australian architects or designers, resident in any country, who enlisted for service in the war with the sea or land forces of the British Empire; (b) Australian architects or designers resident in any country, whose sons or daughters enlisted for service in the war with the forces above-mentioned. Conditions may be obtained on application at the following offices:—(1) Military Headquarters in the capital city of each State of the Commonwealth; (2) High Commissioner's Office, Australia House, Strand, London. Designs must be delivered by April 30, 1926, to The Secretary, Department of Defence, Victoria Barracks, Melbourne; or The High Commissioner for Australia, Australia House, Strand, London. Premiums will be awarded. A deposit of two guineas (returnable) for each set of plans and conditions must accompany the application.

Designs for Marble Memorials.

Following are the awards in the third competition promoted by the Marble Merchants' Association:—

Mr. A. Stokely, 7, Tissington-street, Rotherhithe, S.E.16, second prize, £3.

Mr. A. F. B. Seares, 35, Cowper-road, Wimbledon, S.W.19, second prize, £3.

Mr. Wm. H. Bennett, 19, Collins-place, Edinburgh, third prize, £1 10s.

Mr. Chas. R. King, "Ailsa," 2, Clifton-road, S.E.25, second prize, £3.

Mr. H. G. Towndrow, 4, Wareham-street, New North-road, N.1, first prize, £5.

Fifty-six designs were sent in. We are informed that the merchants will always be pleased to receive designs and suggestions for memorials, and where such designs can be adopted they will be pleased to pay a reasonable sum for them. Designs may be sent to The Secretary, Marble Merchants' Association, Monument House, Monument-street, E.C.3.

Competitions Open.

Particulars published in "Builder."	Sending in date.
New Buildings for Liverpool College, Mossley Hill. Sir Giles Gilbert Scott, R.A., Assessor. Premiums: £500, £300 and £200. Apply to J. H. Lintern, Secretary, Liverpool College, Sefton Park-road, Liverpool.	Aug. 7 .. 1926 Jan. 1
Houses for Smaller Middle-Classes and Intellectual Workers. Held under auspices of International Federation of Building and Public Works. Prizes: 1st, 500 dollars; 2nd, 300 dollars; 3rd, 200 dollars. Write to Director-General of the International Federation, 17, Avenue Carnot, Paris.	Oct. 30 .. Jan. 14
Branch Library, Gabalfa, Cardiff. Limited to qualified architects in Cardiff. Premiums £75, £50, and £30. Mr. Sidney K. Greenslade, F.R.I.B.A., assessor. Apply, with deposit of £2 2s., to Librarian, Central Library, Cardiff.	Nov. 27 .. Jan. 16
Art Gallery and Museum, Birkenhead. Limited to competitors practising within 20 miles of Birkenhead since January 1, 1923. Premiums: £250, £175, £100. Sir Robert Lorimer, A.R.A., assessor. £2 2s. deposit. Apply Curator, Central Public Library, Birkenhead.	Oct. 16 .. Jan. 30
Australian War Memorial, Canberra. Open to architects of Australian birth. Apply High Commissioner, Australia House, Strand, London.	Aug. 14 .. Mar. 31
Royal National Eisteddfod of Wales, Swansea, Competitions: (1) National Parliament House of Wales (Prize, £100); (2) Street Facade to a Large Stores (Prize, £25); (3) Set of Measured Drawings of Architecture (Prize, £25). Apply for programme to publishers, Messrs. Morgan & Higgs, Heathfield-street, Swansea (1s. 2d. post paid). Mr. Arthur Keen, F.R.I.B.A., Assessor.	Nov. 6 .. July 12
Incorporated Architects in Scotland: (1) Rowand Anderson Medal and £100: City Art Gallery and Museum; (2) Rutland Prize (£50) for Study of Materials and Construction; (3) Prize (£10 to £15) for 3rd year Students in Scotland; (4) Maintenance Scholarship, £50 per annum for 3 years. Apply Secretary of the Incorporation, 15, Rutland-square, Edinburgh.	Nov. 6 .. —
Plan for construction of Conference Hall, for League of Nations, Geneva. International Competition, Sir John Burnet being British representative on Jury of Assessors. 100,000 Swiss francs to be divided among architects submitting best plans. Programmes with R.I.B.A., 9, Conduit-street, where intending competitors should apply. Single copies from Secretary-General, League of Nations, Geneva, on payment of 20 Swiss francs.	Jan. 2
Public Hall, Topsham. Premiums £50, £40, and £30 respectively. Mr. Walter Cave, F.R.I.B.A., assessor. Last day for questions, Jan. 1, 1926. Designs to be sent in by April 1, 1926. Conditions from the Clerk to the Parish Council, Topsham, on deposit of £1 ls.	Jan. 1 .. April 1
Secondary School for Girls, Worcester. Premiums 100 guineas and 50 guineas. Mr. Herbert T. Buckland, assessor.	Dec. 11 .. —
Public Memorial, Blackpool. Mr. E. Bertram Kirby, F.R.I.B.A., assessor. Apply to Mr. D. L. Harbottle, Town Clerk, Town Hall, Blackpool. Deposit £1 ls.	Dec. 11 .. Feb. 13
Infectious diseases hospital, Blyden, for 72 beds. (Date of application for particulars now passed)	Dec. 18 .. —
*Proposed new church, Monmouthshire	— .. —
*Proposed new school, Gosport	— .. —
*Proposed new hospital, Guisborough	— .. —

* Competitions when "warned" or vetoed by the R.I.B.A. are starred.

ROYAL ACADEMY EXHIBITION, 1925.

House Inverchapel, Loch Eck, Argyll.

MESSRS. GERALD WELLESLEY & TRENWITH WILLS, Architects.

PROBLEMS IN THE CONSTRUCTION OF BUILDINGS CONSIDERED EXPERIMENTALLY

PROFESSOR E. G. COKER, M.A., D.Sc., F.R.S., M.Inst.C.E., Professor of Civil and Mechanical Engineering, University College, London, read a paper on this subject at University College on Thursday, December 17, to members of the R.I.B.A. Mr Arthur Keen, V.P., R.I.B.A., occupied the chair.

Professor Coker said it was probably the experience of most architects, when designing a new building or altering an old one, that constructional problems arose for which no ready means of solution were known or could be devised from fundamental principles, and reliance must be placed on existing precedents in order to deal with a stress problem of a new type. Such difficulties were not likely to be less in the future, since buildings tend to increase in complexity, and especially so in cities where the business community found it necessary to concentrate in a comparatively small area, and accommodation was needed for a very large number of people who required all the conveniences of modern life for the quick dispatch of business. In recent years the want of such accommodation at a reasonable cost had been felt in the City of London and in many other places. This had led to suggestions for tall buildings in which constructional problems arose of great complexity. In a sense we were fortunate in that many of these problems had already been solved for us in other parts of the world, although new factors were bound to occur if very high buildings were constructed here similar to those found in New York and many other American and Canadian cities. Attention was drawn to some apparently simple problems during a recent alteration and extension of the Engineering Building at University College. These had to be settled at once, as they arose, but references made at the time to standard works on building construction appeared to give little precise information concerning these problems, and if a solution was indicated it was generally either a rule of thumb method, of which the origin was difficult if not impossible to trace, and often of such simplicity that it seemed unlikely to have a very substantial basis.

Direct experiments on masonry, brickwork and concrete structures were in general costly to carry out, and the results were often not capable of exact interpretation, since the probable distribution of the stresses was usually unknown beforehand and was extremely difficult to observe during the experiments. Whatever information could be gleaned was therefore obtainable from the final condition of the structure after failure had taken place. Fortunately it was not difficult to make experiments on models of walls, floors, pillars and like elements of buildings, in which the distribution of stress caused by loading could be followed with ease and accuracy nearly up to failure, and there appeared to be a considerable field of work awaiting the investigator in this direction.

In order to illustrate a procedure which might be adopted for the examination of the stress distribution in buildings, it would be convenient to illustrate the general principles of the mode of investigation followed by reference to a specific case of a brick wall, say 18 in. thick with a footing spread out to give a base of 36 in. width in three steps of 3 in., horizontally and vertically. If a short length of this wall be taken resting on a flat surface below and loaded uniformly all over its upper surface above, it would be subjected to stress throughout very similar to that experienced in a long wall loaded in the same fashion, and at and near the footing the state of stress was sure to be somewhat complicated because of the cross sectional area changing suddenly at definite intervals. If a model of this wall were constructed of transparent material and was viewed in a beam of polarised light, it was possible to find the average stress in any

part of this structure, because the loading caused the transparent material to become doubly refractive. This temporary double refraction produced by loading was a valuable means of finding the state of stress in the interior of a transparent body, especially as the stresses found could be measured with an accuracy of, say, ± 2 per cent., if sufficient care was taken, and it was moreover capable of proof for bodies which conform to the elastic law that the stresses found in such models were the same as those experienced in similar monolithic structures of similar shape loaded in the same fashion.

Turning to the problem of determining the distribution of stress in a monolithic footing for a wall taken for convenience as 18 in. thick, spread out to 36 in. by stepped intervals of $4\frac{1}{2}$ in. horizontally and vertically, the speaker said the most important matter was to determine the maximum intensity of stress and its position, and the maximum stress occurred at the ends of the junction of the wall with the footing. Indeed, nowhere else did the stress intensity approach that found at these points. In order to determine the distribution here, advantage was taken of the fact that one principal stress was zero at the contour, and in order to trace the variation in intensity of the other the movement of the purple blue band was observed for different loads, and where it intersected the contour the stress for a definite load was obtained by simple proportion. A total load of 44 lb. on the specimen, giving an average distribution on the upper part of the model of 587 lb. per sq. in. was found to produce a maximum intensity of 1,785 lb. per sq. in. at a point just below the line of junction of the wall with the footing, and on the curved fillet of 1.32 in. radius.

It would be of interest to examine the question of the effect of cutting away the stepped footings to give a sloping contour of 45° , as this problem was the starting point of this investigation, as described above. The projecting angles of the steps were under no stress, although the re-entrant angles were under stress which diminished in intensity with the spread of the base. It seemed probable, therefore, that the removal of the parts under no stress would not alter the distribution very much, even although this process involved a cut along a line tangential to the re-entrant angles. Even in a footing so drastically modified, only slight changes took place in the directions of the lines of principal stress. With a slightly increased average stress of 585 lb. per sq. in. the maximum stress fell from 1,785 lb. per sq. in. to 1,640 lb. per sq. in. In order to put this beyond all doubt, other models were made and the general result confirmed that cutting away a footing in this manner lowered the stress at the join; but this was accompanied by a modification of the stress along the contour below the join, in which there was at first a very rapid diminution of stress intensity which ultimately became almost negligible when the contour again became horizontal.

Although the chief interest in the problem was in the place of maximum stress, there were various other stress distributions which might claim attention, and one of these was the stress distribution along the longitudinal central section of the wall footing.

The effect of the external contour upon this was unlikely to be very great, although it might be appreciable, while the more or less abrupt change of section tended to produce cross stress. In the stepped footing, cross-compression stress began to appear in the wall well above the footing, and attained its maximum value at or near the junction; it then decreased in value, and ultimately became zero at a point rather below the junction of the footing with the base. The main longi-

tudinal stress showed a gradual diminution of stress as it passed through the region of discontinuity from 587 lb. per sq. in. to values which were influenced and raised by the end contact pressures.

In the case of modified footing, distributions were found of much the same kind, thus confirming the view that for this longitudinal section the influence of the contour was practically negligible and that the cross stress, although small numerically, extended a considerable distance into the wall itself. The stress distributions at other horizontal sections of the stepped footing were also of interest, but were more difficult to determine, as their average values were low. It was found necessary to increase the load on the model to give an average value of 1,470 lb. per sq. in. on the upper section in order to determine the stress intensity at the lower sections. In the stepped footing this produced some relative change at the lower section, as the maximum stresses tended to produce some permanent deformation which would tend to alter the stress distribution in its neighbourhood. The resulting distribution showed the interesting result that the vertical stress p_n across the section rose to a maximum inside the model, due to the sudden discontinuity of the contour at $\pm .5$ in. and its serrated outline. The cross stress was relatively small.

Stress Distribution in an Unsymmetrical Footing.

In some cases it was desirable and necessary to increase the basal area of a wall by footings on one side only, and this gave a cross section of an unsymmetrical character, which was of interest and importance in practical construction. It was evident that in such a case the effect of loading one end uniformly would cause a non-uniform contact loading at the other, and in general an unsymmetrical stress distribution. An opportunity was taken of examining one case by cutting off one side of the stepped footing, giving a model with end faces plane and truly parallel, and loaded in a testing machine with metal end pressure plates also kept truly parallel. The conditions of loading were therefore not such as to give uniform pressures at either end, but were rather such as to tend to the production of strains in the model which, when summed vertically, shortened the model by equal amounts at any vertical section provided contact was maintained over the end faces. This condition of loading was no doubt affected by the length of the model and the position of the change of section with reference to the ends, so that the applications of these stress measurements to practical problems of a similar nature were strictly limited, but the results were useful in forming a general idea of this type of wall problem. Under this system of load, or rather strain, the isoclinics and lines of principal stress differed a good deal from the symmetrical case, and an optical examination indicated that the greatest intensity of stress was still found at the join of the wall to the footing where a break of section occurred. As this cross section was clearly the most important one, it had been examined somewhat carefully, and measurements showed that for a mean average stress of 587 lb. per sq. in. the maximum stress was 1,450 lb. per sq. in. on one side and fell to 460 lb. per sq. in. on the other, but the fall from the maximum was very rapid and was practically complete in a horizontal distance of .2 in., measured along the section. The cross stress was not very important, since it only reached a maximum value of 160 lb. per sq. in. at .05 in. from the left hand contour.

These illustrative examples were probably sufficient to give an idea of a form of investigation on the stress distributions in buildings, which was capable of great extension, since there were any number of still more complicated problems other than the types selected which could be solved, and which would probably repay examination. It might therefore be of interest to outline the possibilities of

further work in this direction. No attempt had been made to reproduce the features of the construction of building made by assembling bricks or masonry blocks bonded together in various familiar ways, but it would not be difficult to construct models in which such units were cemented together, and since there was a considerable range of transparent bodies available it was also possible to build up composite structures to represent the use of materials like brick, stone, cement and steel in combination.

In particular, the question of stress distribution in reinforced concrete structures offered a very promising field of work, as experiments showed on the union of transparent materials with thin rods of organic substances of superior elasticity or of metal wires. In another direction it was found that the shaping of sections used in steel frameworks, and the riveting of these together, was quite a feasible operation, and had, in fact, been accomplished for a roof. We might, therefore, hope that further investigation of this kind on models of buildings may afford some help to architects in providing economical structures suitable for modern necessities. In conclusion he wished to express his warmest thanks to his research assistants, Mr. R. Miyasima and Miss Janet Harris, B.Sc., who had made nearly all the detailed observations described in the paper.

MR. VERNON CROMPTON (chairman of the Science Standing Committee of the Royal Institute of British Architects) said he often thought architects gave too little attention to the scientific side of building. In the medical profession doctors from time to time visited hospitals and kept in touch with the very latest developments of the science, and were, therefore, more efficient in their profession than they would be otherwise. So far as his experience went, it was very rarely that architects attended lectures such as they had had that evening to keep in touch with what the engineers were doing. It was becoming more and more necessary that architects should keep abreast of the engineering side of their profession; but as building became more and more complex it was increasingly difficult for them to deal with all the problems arising out of the erection of a large building. They could only tackle present-day building problems by going hand-in-hand with engineers, but it was absolutely essential that the whole of the engineering side of a building should not be left entirely to the engineer. Generally speaking, architects should know sufficient of the engineering side to be able to follow the engineer even in his intricate calculations so as to some extent to be able to keep control of the whole of the building operations. He thought the experiments conducted by Professor Coker would be very valuable with work such as that now going on at St. Paul's Cathedral. The results would certainly be valuable in everyday practice. Such problems as the reason for the cracks which usually appeared at the bottom of a window-jamb had, he thought, been explained that evening. The experiment which proved that the effect of stresses on an opening in a wall was much reduced if the corners were rounded seemed to put architects in somewhat of a difficulty, suggesting that all angles, whether external or internal, should be rounded if the building were to be as safe as it was possible to make it. If that were so, it seemed that reinforced concrete would be a particularly suitable material for the purpose.

DR. OSCAR FABER, O.B.E., said people did not always realise to what extent progress was due to the work in the laboratory. It was common to find the feeling that so long as an architect or engineer did sufficient work in practice he would get to know enough about any branch of his work. Up to a point that was true, but the factor of safety they had to employ in actual practice, necessary as it was, had the effect of obscuring scientific truths which underlay the experiments carried out on a large scale in the course of their everyday work. They built a certain size wall with a certain size footing, and found that they carried their load perfectly, so they were satisfied,

but they never really knew whether that wall had a factor of safety of 4 or 40. They could thus make very considerable errors in calculations without those errors ever being revealed. It was only in the laboratory that they were able to make experiments in such a way as to leave something definite. He rather preferred a different method of testing from that used by the lecturer, namely, testing to destruction. It would be found that an ordinary reinforced concrete beam would carry two or three times the load for which it was calculated, owing to the changes in the distribution of the stresses that took place due to the difference between the tensile and compressive strength, and that factor should be taken into account in making experiments. He would like to put this question: On, say, a 14 in. wall which would safely carry 30 tons to the sq. ft. the lecturer had shown that there would be two or three times the normal stress on the footings; but could they imagine in actual practice that the wall would be very much weaker at the footing than higher up? That was a point that should be considered; he did not think a wall provided with a footing would fail at any similar load, in spite of the higher stress shown in the experiments to occur at the corner of the footing. The speaker then demonstrated on the blackboard an example of the effect of compression on a projection. The case was the construction of about fifty reinforced concrete stanchions with brackets supporting beams. The beams

were supported on the brackets, and provided with metal roller joints to allow for movement due to expansion and contraction of the beams. The first stanchion to be loaded showed a fine hair crack nearly parallel with the outer face of the bracket (shown by a broken line in the diagram). To prevent this occurring in the other brackets they were heavily reinforced in a direction at right angles to the face; but this proved of no avail, as the cracks still appeared. He ultimately found that the cracks were caused by the weight of the beams being applied over about the inner two-thirds of the bracket only. The effect of this was that the part of the bracket under load was subject to compression while the other part was not, with the result that there was shear along the line between the part of the bracket under compression and the part on the outer face. The difficulty was solved by using smaller brackets, so that the whole was under compression; the cracks were caused solely by using an excess of material.

MR. E. FIANDER ETCHELLS said architects had so many problems to deal with that they were compelled to turn to simple methods, but such methods often proved misleading. It was, for instance, common to take a uniform load over the whole of a floor, but that would hardly ever be the actual condition under which the floor was used. Although they often

adopted compromises in order to avoid complexities, it was necessary to call in the specialist designer for works of any importance. The experiments described by the lecturer would have been of the greatest value to Wren in the design of St. Paul's, and had they preceded Wren St. Paul's would not have been in the condition it was in to-day. Wren assumed that all his pressures were central; that was the common practice of that time, and was in fact still used by some architects to this day, and one of the consequences was the appearance of cracks. To talk of a factor of safety of 4 was misleading, because the factor of safety was more often 2 than 4. No structure was perfect; every simple stress was affected by secondary stresses, and might affect the strength of the building by 100 per cent. The factor of safety of 4 was rather a figure of speech, and had often no relation to the facts. In connection with the experiments on the effect of compression on projections, this chiefly applied to cornices, and they need not have much fear on that account. The higher the projection, the less the weight, and therefore the less the liability to shear, so that a high cornice would be less likely to be affected in this way than a projection low down on a building.

MR. ARTHUR KEEN said they were all conscious of the tremendous progress made within recent years as a result of the work of scientists, both in materials and structure, and they were very much indebted to the lecturer for his exposition that evening.

A hearty vote of thanks to the lecturer terminated the proceedings.

THE COLLEGE OF ESTATE MANAGEMENT

The Economics of Rent.

In a recent lecture at the College of Estate Management, Professor Douglas Knoop, M.A., of Sheffield, examined the subject of situation as a determining factor in rent payments. He said that the real importance of situational rents came in connection with buildings and building sites. The shopkeeper paid this situational rent for a site which was not only accessible but was familiar to the shopping public. In the case of offices, again, it was necessary that these should be fairly central, though not necessarily in main streets, and an important factor appeared to be that an office should be in the neighbourhood of other offices where the same kind of business was carried on. It was not quite easy to see why banking offices should congregate in one quarter of a city, offices of consulting engineers in another quarter, and so on, but this was, apparently, an advantage, for which a situational rent was paid.

With the demand of the public for favourable and central sites came a demand for higher buildings; in this country height was generally conditioned by municipal regulation, but in New York the only limit to the height to which a building could be carried was determined by the deprivation of light and air in the lower portions.

The lecturer explained the meaning of ground rents. At first glance these might be regarded as economic rents—payment in respect of natural advantages of the site. But the advantages of certain urban sites could be increased by human effort, and in these cases some part of the ground rent represented interest on capital outlay or reward for risks taken.

Surveying by Air.

The Aircraft Operating Company has just completed the first aerial survey to be commissioned by the Ordnance Survey Department. The Eastbourne district was chosen for the experiment, because the uneven and varied country presents many difficulties to the aerial photographer. It is probable, if the Ordnance Survey Department is satisfied with this preliminary experiment, that aerial photography will be employed for re-mapping the whole of Britain.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Theory of Architecture.

SIR,—Mr. W. Martin Kaye's letter in your last issue on the theory of architecture is an admirable and well-timed analysis of the present defects in our system of architectural education. They are so obvious that one is surprised that they need to be stated at all.

It is a curious fact that in spite of all the talk about new styles for new materials our best men are still producing most scholarly work which is a real development of the best traditions of British Renaissance. From the time of Arnolfo di Cambio and Nicolla Pisano down to the time of Norman Shaw nearly all the outstanding men in the architectural, sculptural and decorative world were men who studied the masterpieces of their predecessors. Measuring and sketching of old work seems to have fallen into disfavour among students of the present day, but it is obvious that an intelligent analysis of "the reason why and the reason why not" in the design of the best examples of old work is the surest method of acquiring a sound instinct for the proper treatment of new materials in new work.

Such work by modern writers as Mr. Martin Kaye has named, have done much to prove the truth of his assertions. If the men trained under this system during the last 25 or 30 years do not seem to have justified the system, it must be remembered that since the South African War, and more so since the Great War, they have had little opportunity of using their knowledge in high-class work. One might safely say that for every real work of architecture erected there are at least 20 men qualified to undertake the work if the work could be properly distributed.

History proves that in all ages when architecture, the crafts and arts decline, a nation is on the down grade. What we have to do is to fight against the spirit of the times, and stem

the flood of economic twaddle by proving that we cannot escape the law of cause and effect.

The Premier spoke the truth when he said recently that housing in Scotland had become a national scandal (we have seen some appalling schemes south of the Tweed also), but anything the Government is likely to suggest will not be likely to improve matters. It is doubtful if the man in the street ever knew much about architecture, and it is doubtful if his so-called education would ever improve matters. What he has got to learn is that he knows nothing about it, and is never likely to know enough even to plan or criticise the design of his own house. Why everybody is supposed to know about the arts (the most subtle and complicated of all professions) will ever remain a mystery.

Ferro-concrete has come to stay, but it will have to pass through the evolution of design from being a purely structural medium to a work of art like all other materials. It took several centuries for the Romanesque to evolve into the glories of the Decorated, and the process must be repeated by natural evolution if it is to take its place permanently as a contribution to the world's art. Mr. Martin Kaye is to be congratulated on the clearness and insight shown in his letter, and it is to be hoped that it will lead to a simplification of the methods of arriving at a decision as to whether a man is or is not qualified for the status as an architect.

WILLIAM DAVIDSON.

Edinburgh.

The Incorporated Association of Architects and Surveyors.

SIR,—It is good to read that you are not in sympathy with the suggestion of Mr. Woodcock that you should not give publicity to the affairs or transactions of the newly-formed Incorporated Association of Architects and Surveyors. Mr. Woodcock's belief that, if you acted on his peevish suggestion, the new association would cease to exist is absurd. If he knew the strength of this lusty infant, and the

hundreds of architects who have joined it, he would have hesitated before making such a suggestion.

High-handed autocratic methods, if practised nowadays, invariably recoil upon the heads of the practitioners, and because many architects have sampled these methods, and have as a consequence been filled with suspicion and mistrust, they are joining an association which will guard its members' interests and treat its members as members rather than as pawns. Much has been written of the methods that have been sponsored by the body to which Mr. Woodcock belongs, and it would not serve any useful purpose to add to an already displeasing list.

Because the new association is business-like, and because it believes in its convictions that its existence is necessary for the safety of architects who are not members of the Big Body, it is bound to continue along the road of prosperity upon which it has made such a splendid start.

G. PUGH.

Durban's War Memorial.

Durban's war memorial consists of a granite cenotaph, 56 ft. high, of which the architect is Mr. H. L. G. Pilkington. At the base lies the figure of a warrior, and above it sculpture representing his soul being received by two angels; this has been executed in glazed terracotta, of which there is fourteen tons, by Mr. Harold and Mrs. Phoebe Stabler, in conjunction with Messrs. Carter, Stabler & Adams, pottery makers.

American Colossal Monument.

The *Christian Science Monitor* states that a bas-relief monument is to be carved on the face of Stone Mountain. Mr. Augustus Lukeman, the sculptor, selected by the monument Association, has prepared a design showing a body of galloping horsemen, one of which, that representing General Lee, is over 153 ft. high.

A Don Quixote Memorial.

The Provincial Cervantes Committee propose to erect a 170 ft. figure of Don Quixote, mounted on Rocinante, together with Sancho and Rucio, on the Toboso plain. It is estimated that the building of this monument will take seven years, and that it will cost over £1,000,000.

Design for a Summer School for a Political Party.

By MR. F. N. ASTBURY. (Fifth-year work (Liverpool University School of Architecture).)

WATERLOO BRIDGE

MR. RONALD P. JONES, F.R.I.B.A., L.C.C., writes:—It would serve no useful purpose to give a detailed report of the speeches at the debate on Tuesday, December 15, but some account of the proceedings should be given, and in justice to the thirty-two members who voted for preservation, their names should be placed on record. As I have been a member of the Council only since last March, I could not judge beforehand how opinion would be divided, but it was evident from the moment that Mr. Gatti began his speech to move the amendment for the destruction of the bridge, that the result was a foregone conclusion. The important point which emerged from his arguments was that the 'destroyers' have not faced the problem of how to deal with the increased traffic when it reaches the Strand, and he touched vaguely on the alternative of a Strand subway, or bridge, without committing himself to either (as indeed he could not, because a few moments' inspection of the model for the subway which exists at the County Hall, will convince anyone that it would only create more difficulties than it solves).

Lord Falmouth, in seconding, emphasised the obstacles to the Charing Cross Bridge as the real solution of the question, and the dangers of underpinning as an engineering operation, which Mr. Culpin later pointed out were no greater than the dangers involved in demolition.

Mr. Norman, in opposing the amendment, argued that the Bridge Committee in their present recommendation were really consistent, and that the Council does habitually resort to outside expert opinion in deciding technical matters. He also recalled many other recent cases where the 'claims of art' (as the Report puts it) have been held to over-rule those of 'utility,' e.g., the Whitgift Hospital. Following him I claimed the privilege of a 'maiden speech,' and called in aid every argument which has been used in support of preservation, both positively on the 'claims of art,' and negatively against the 'claims of utility,' which I maintain are a complete fallacy, as in fact no one dared to assert that the six-line bridge would be of any use until the whole of the surroundings on both sides of the river have been reconstructed.

Mr. Morrison, leader of the Labour Party, made use of the curious argument that it would be impossible to find a technical tribunal, because all the available engineering talent had already declared itself on one side or the other; and repeated his claim made a few weeks ago that modern architects are quite able to produce as fine a bridge.

Mr. Culpin (of the Architecture Club, and a member of the 'Conference of Societies') dealt with this latter point, and others arising out of previous speeches. There also spoke, for the amendment, Mr. J. D. Gilbert and Mr. Tasker, M.P., and against it, Dr. Scott Lidgett, Mr. Meinertzhagen and Captain Swinton, the last in a few beautifully-phrased sentences, which he called the 'swan-song' of the bridge.

It should be noted that while the division cut across the party system and the whips were taken off, as they say in Parliamentary terms, the Labour Party at the last moment decided to insist on its members voting solid for destruction, and only one refused to be bound—Mr. Culpin, who voted for preservation. The result, however, was not affected by this, and was decided by the fifty-seven Municipal Reform members who supported the amendment.

The names of the thirty-two 'preservers' are as follows:—

Municipal Reformers: Sir F. Anderton, Miss Cazalet, Sir Cyril Cobb, M.P., Captain C. E. Cobb, E. M. Dence, Mrs. Emmet, Lady Eve, T. C. Goff, H. C. Gooch, W. W. Grantham, K.C., H. J. Greenwood, M. Hays, Miss Hill, Mrs. Hopkins, Sir G. Hume, M.P., Colonel Levita, T. Littlejohns, W. F. Marchant, E. L. Meinertzhagen, R. C. Norman, Sir L. Pound,

Dr. Adeline Roberts, H. V. Rowe, Captain Swinton, Admiral Taylor, Mrs. Worsthorne.

Progressives: H. A. Baker, Percy Harris, M.P., W. C. Johnson, R. P. Jones, Rev. J. Scott Lidgett, D.D.

Labour: E. G. Culpin.

The list includes five past-Chairmen of the Council, and the present Chairmen of the Housing Committee, Improvements Committee and Bridges Sub-Committee.

We quote the following from *The Times*. In a letter Professor Beresford Pite writes:—

"An outrage on national sentiment, that would have been considered absurdly impossible a year ago, has now become imminent, as the London County Council have decided to abrogate the most beautiful group of classical buildings now existing in the world. Ancient Rome, in its glory, never possessed such a composition as that of the masses of the Embankment walls curving under Waterloo Bridge, crowned by the majestic lines of the stories of Somerset House, with the Dome of St. Paul's as its distant peak of vision.

"As this wonderful accident of gracious art is to be sacrificed, to a necessity that is assumed rather than proved, may not the nation appeal for a judicial consideration of the whole circumstances and for a fuller elucidation of the possibilities of architectural resource? It is the opportunity for a Royal Commission. The factors of the problem, of public convenience, of scientific construction, of artistic and monumental value, as well as of economy and cost, all need educating and judgment. . . .

"No widely-conceived plan for London traffic across the river has yet been made, though the disposition of future bridges in view of modern traffic developments should be determined. The confusion, which permits St. Paul's Bridge to be promoted and abandoned, Southwark Bridge to be rebuilt and but partly used, the widening of Charing Cross Railway Bridge to be defeated, and Lambeth Bridge to be reconstructed in a *melange* of materials, is sufficiently ridiculous, though entirely characteristic, to support the plea for a new attempt to examine the whole problem and to save London from the time-lasting reproach of destroying the chief architectural beauty of its wonderful river."

Mr. F. L. Griggs, A.R.A., in the course of a letter to the same newspaper, says:—"With the recent spoliation of New London Bridge and the destruction of Waterloo Bridge, London, will not possess one of real beauty, instead of having—as it ought, with the opportunity so noble a river affords—the finest series in the world. . . . It looks as if Waterloo Bridge is to be sacrificed because a majority of the London County Council, blind to its beauty and deaf to the national appeal for its preservation, wish to demonstrate their power."

Mr. H. H. Dalrymple Hay writes:—"The question is still open as to whether it is possible or not to underpin the bridge at a reasonable cost. We say that it can be done. The Council's engineers apparently say that it cannot be done. The London County Council, as a lay body, cannot decide such a question, and the reasonable thing that ought to be done is to ask some outside, absolutely independent and impartial body to go thoroughly into the question."

Mr. W. R. Davidge, in an interview, said:—"The following points in particular require most careful consideration:—

"(1) That the east and west traffic in the Strand would be most seriously hampered by any great increase of traffic across Waterloo Bridge.

"(2) That the London and Home Counties Traffic Advisory Committee have not yet had an opportunity of considering the effect of the proposed new bridge at this point.

"(3) That it has not yet been proved that a new bridge is necessary at this point to meet the traffic needs.

"At least two-thirds of the existing bridge is in sound condition, and that only two arches out of nine actually need to be taken down."

Mr. A. R. Powys, in a statement, said:—"That the bridge can be maintained by strengthening the foundations has been proved, but there is, as yet, no conclusive evidence as to the needs of traffic, though there are very many opinions. I cannot believe that this decision is final, that a way will not yet be found to retain the bridge. If one thinks of the fine buildings that no longer add grace, beauty, and distinction to London, no single one of them, not even Newgate Prison, has hurt London and the pride of its citizens as will the destruction of Waterloo Bridge."

In his speech in the Council Chamber Mr. E. G. Culpin said that the opponents of destruction urged their claim on the following grounds:—(1) Economy: Their scheme would save an enormous amount of money. (2) Traffic: Mr. Gatti's proposal would accentuate and perpetuate traffic difficulties. A bridge with six lines of traffic would create chaos in the Strand. The solution of the Waterloo Bridge problem was a new bridge at Charing Cross. (3) Beauty: Waterloo was the only fine bridge in London. It stood a conspicuous example of architectural design, particularly "in the wonderful distinction of its junction with Somerset House." The destruction of the bridge would be an artistic tragedy—an offence against the educated opinion of the world which would never be forgotten against them. The recommendation of the Committee did not commit the Council to any immediate plan. It asked that on a matter where there was a distinct cleavage of professional opinion, they should take the calm judgment of an independent tribunal, free from the prejudices on either side; weighing judicially that evidence when brought before them. It asks that there might be this considered judgment before the verdict was given. He said that in their judgment underpinning was practicable; that the repair of the bridge would be less costly, less dangerous, and attended by less interference with traffic than the proposals for rebuilding.

AMERICAN OFFICE PRACTICE

THE conditions of architectural practice in England and America differ so widely that it is impossible to reduce them, so to speak, to a common denominator. Mr. Frederick J. Adams' little "Manual of Office Practice" is a survey of the routine of a typical American Office—is, in fact, revised and enlarged from the version compiled by the same author for use in the office of McKim, Mead and White. Hence it contains much information that, while showing the extent and intricacy of detail in American office practice, has mainly an academic interest for the British architect. The sections dealing with Ordinances and Building Code for work in and outside Greater New York, have, for all practical purposes, purely a local interest, but most of the other sections, especially those that deal with Office Administration, Hints for Draughtsmen, Checking List, and Forms, indicate directions and ways in which our own methods are perhaps susceptible to improvement. The average English office, with its one principal and two or three assistants, is not to be compared with the typical American office, with its three or more principals, its many specialist assistants, and small army of draughtsmen, and, national prejudices being what they are, it is doubtful whether the American system will ever come into force on this side of the Atlantic. Many of the working processes of architectural design are, however, common to both countries, and it is perhaps in the efficiency of its routine that the American system has most to teach the English practitioner. As a careful record of American office practice, this little book deserves a place on the bookshelf of any architect who is keen to improve or tighten up his own office organisation.

**American Office Practice*. By Frederick J. Adams (London: B. T. Batsford). Price 7/6.

BOOK REVIEWS

Florence and the Medici.

The Golden Age of the Medici. By SELWYN BRINTON, M.A., F.R.S.A. (Methuen.) 15s. net.

Those of us who have visited Florence will no doubt have seen the Botticelli, Angelico, Masaccio, and Lippo Lippi canvases and frescoes; the fictiles of the two Della Robbias and the bronzes and marbles of Donatello; to say nothing of the wondrous Lorenzo Ghiberti gates of the Baptistery, which, as Michaelangelo himself said, were worthy to be those of Paradise. All these are of the golden age of Cosimo, Piero, and Lorenzo de Medici—three generations of the Merchant Princes who ruled the destinies of Florence throughout the sixty greatest years of Florentine story, the last sixty years of the *cinque-cento*. It is of this period (1434 to 1494), in the history of the Florentine Republic, that Mr. Selwyn Brinton's well-written and illustrated book mainly treats. Amongst the thirty-two photographic illustrations of Florentine buildings and other works of art he gives us one of "The Palace and Piazza of the Signoria of Florence," "that centre and symbol of civic life" (to quote the author), where dwelt "the Supreme Magistracy who guarded her liberties and wielded her power, never leaving her walls during their term of office." Two other pictures show Filippo Brunelleschi's little gem of the early Renaissance, "The Chapel of the Pazzi"; and his masterpiece, "The Cupola of the Duomo." Another shows Cosimo's "House that Caps the Corner"—the munificent house which harboured Fra Lippo Lippi, "a painting for the great man, saints and saints and saints again." The reproductions of Sandro Botticelli's "Madonna of the Magnificat," in the Uffizi Gallery, and his "Sleeping Mars and Venus," in our own National Gallery,

are about as good as possible in black-and-white renderings.

It is a pleasure to read the author's "Golden Age of the Medici," with its lucid word pictures of the civic life of Florence, her arts and crafts, her poets, scholars, painters and sculptors, from the advent of Cosimo Pater Patrie to the exit of his grandson, Lorenzo Il Magnifico. It is a book that will appeal to the historical student, and for the merest Philistine will put life into the cold clays of the Della Robbias at South Kensington, and help him to see behind the mere paint of the Botticellis in Trafalgar Square. The final chapter, "The Fall of the Casa Medici," is a critical and judicious piece of writing, with its conclusion finishing, "Yet the message of art and scholarship which she in those days had given was, like fertilising pollen, to break forth throughout Europe into new forms of human thought; and that in the North, in those heroic states of Holland and in our own island, set in the silver sea, the torch of liberty had been caught from the dying hands of these old Italian Republics to be kept alight through the ages, and carried to new and mighty nations across the western seas."

Old English Houses. By J. ALFRED GOTCH, M.A. (Hon.) Oxon, F.S.A. P.P.R.I.B.A. With numerous illustrations. (Methuen.) 16s.

THIS book, coming from such an authority as Mr. Gotch, contains information that is authentic. The reader can be assured that the labour has been thorough, for the researches have been undertaken at first hand. This is the sixth book from the author's pen dealing with English architecture. The book opens with a description of mediæval houses; thence the reader is conducted through the succeeding centuries down to the beginning of the Victorian

era. It is a welcome change to read about old houses as laymen. To the making of books on architecture there is no limit. There are some examples of compilation consisting of a few photographs and some introductory matter. Other books are all text and no sermon; and some others exhibit that marked personal bias which is negative. When an architect with the author's ability undertakes to write for the public, professional men begin to see the value of simple statement, and wonder why books with the human touch are so few. The description of the mediæval house is written to include the materials used in the construction. The habits of the time and the standard of living then thought desirable are dealt with. There are illustrations of castles like Oakham, Warkworth, Stokesay, Bodiam, and Penshurst. As the pages are turned, it is made clear that the features of St. James's Palace in London in some part reflect the earlier tradition. Who, may we ask, even among architects, gives a thought to such matters in the press of modern life? But there is the evidence of St. James's Castle front, in the midst of London. The Tudor house has been taken by the author as reliable evidence of the social system of the Tudors as well as marking the sequence of building. From thence the reader is told of the courtyards and halls of Shakespeare's time. As the author states, "The dwellings were, of course, the product of what had gone before them; a development of much earlier houses." He writes of the classic invasion which manifested itself in the increase of horizontal lines and in the detail applied to doors and windows. Mention is made of the buildings in the University cities—the fireplaces, stairways, and furnishings. In this regard, we would draw the author's attention to the illustration of Bradninch Manor—a very old photograph which hardly does justice to the efforts of the late Mr. Locke Radford, who had been at great pains to place the original furniture in the room. The Jacobean house is summarily dismissed by Mr. Gotch, who writes: "The houses of James I's time were essentially the same as those of Elizabeth's. They had to satisfy similar wants; they were subject to the same influences in their architectural treatment." Mr. Gotch, from his vast store of knowledge, might have treated his readers to something a little fuller. As was to be expected, there is a full account of Inigo Jones, who is the hero of the first Carolean régime. We read of his early travels, of the memorable quarrel with Jonson, and of his influence on contemporary surveyors of the time, to whom must be attributed many of the minor works. Mr. Gotch might have led us a little further behind the scenes and have shown the smoke-grimed countenance of old Inigo, as he appeared when taken prisoner at Basing House in company with Wencelous Hollar. Jones passes; the way is paved for Webb; and later Christopher Wren directs the royal works and organises the rebuilding of London. Mr. Gotch skilfully interweaves his plain tale of the development of the house with statements of social life. At all stages he avoids as far as possible the tiresome introduction of dates and the equally tiresome specification manner. In treating of the small house, the author is sure of sympathy. Such examples as at Woodford, Northamptonshire, and others, recording the "broad belt of stone running from Somerset in a north-easterly direction up to Rutland," call attention to the geographical statement which is not the least attribute of old building practice. The concluding chapter treats of the Georgian house, but here we are aware of a slight disappointment. This section of the subject is so modern that every layman understands the meaning of the later houses. Whereas the older houses, except in certain districts, are few, there is a wealth of Georgian building still serving for all grades of society. We should like to see the author continuing his plain unvarnished tale in a further book to include the Victorian house and the new houses of the last fifty years. The layman wants to know the present position, and he is best helped to that viewpoint by architects who write in Mr. Gotch's humour.

ILLUSTRATIONS**Design for a County Hall.**

This design, by Mr. H. E. Furze, has been awarded the R.A. Gold Medal and Edward Stott Travelling Studentship (£200). A criticism of it was given in our last issue.

Design for a Parish Hall.

This design, by Mr. H. J. Coates, was awarded the first prize (£10) and silver medal in the recent Royal Academy Students' Competition for an Architectural Design.

Summer School for a Political Party.

We illustrate this week an example of recent fifth-year work, by Mr. F. N. Astbury, in the Liverpool University School of Architecture.

New House, Fourth-avenue, Hove.

This house is built in a South Water facing brick with old rustic Broseley pattern tiles on the roof. The front boundary fence consists of an oak paling mounted on a dwarf brick wall. The general contractors were Messrs. Kirk & Randall, of London, and the contract price was £3,670. The principal sub-contractors were: C. S. Jackson & Co., hot water supply, sanitary goods, and mantels; Williams & Williams, steel casements; Catchpole & Co., electric fittings; Carter & Aynsley, Ltd., ironmongery; and Pinchin, Johnson & Co., paint and distemper. Mr. F. W. Rees, A.R.I.B.A., was the architect.

Inverchapel Lodge, Argyll.

This illustration shows alterations and additions proposed at Inverchapel Lodge, Argyll. The house was originally built in 1921, the requirements of the client being for a fishing lodge for the accommodation of two or three fishermen and one or two servants. In 1923 this accommodation was found to be inadequate, and a servants' wing was added to the north-east corner of the house containing three additional servants' bedrooms and other offices. Recently, owing to the abandonment of a scheme for a larger house on the same estate, the further additions embodied in the illustrations were under consideration. The new work consists of everything to the right of and including the gable on the west front, and the house will then provide accommodation for a large drawing-room, dining-room, smoking-room, and eight best bedrooms, with six servants' bedrooms and offices. The exterior of the house is roughcast and colour-washed primrose with stone dressings; the roof is covered with small black Ballachulish slates.

The architects are Messrs. Wellesley & Wills. The general contractor, who carried out the existing work, was Mr. E. Cameron, of Dunoon, Argyll, N.B.

THE INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS

Lectures on House Construction.

COLONEL PROBYN, D.S.O., M.B., B.S., D.P.H., of Lincoln's Inn, Barrister-at-Law, for some time Sanitary Specialist Officer, South China Command, and one of the Readers of the new Association's College, recently delivered a series of lectures to members of the Association on house construction from the sanitary point of view. In one of these he discussed the question of a site from a geological point of view. Soils, he said, had a great effect upon the health of a locality, and they should be considered from the point of view of their power of retaining moisture, air and heat. Porous soils (gravels, sands and sandstones) were said to be the healthiest, as they were the driest, but unfortunately they were easily polluted by leaking drains and cesspools. The presence of organic matters in the soil increased its capacity for retention of moisture. Granites, metamorphic rocks, dense clays, hard limestones and dolomites were not wholly non-absorbent, but for practical purposes might be considered waterproof. Pure chalk formed a healthy site, but there was danger of subsidence in very dry seasons. Gravel beds, if very thick, were good, but useless when shallow.

Reclaimed or alluvial lands should be avoided always, as they were notably damp. Artificial or made soils in towns should also be avoided, as they were often mere rubbish heaps full of decomposing organic matter. It was unsafe to build on such made soils unless they had been exposed to the sun and air for at least three years, and trees should be grown on such soils.

Ground air always filled the space in surface soils not occupied by water or solid particles. It was generally moist, but always impure by reason of the decomposition of vegetable and occasional organic matter and of possible contamination by sewage gases and emanations from cesspools. Sometimes these emanations were the conveyors of disease germs. We had the three great requirements present for the growth of microbes: (1) Oxygen in ground air; (2) the moisture in ground water; and (3) heat, except in winter time or in very cold climates.

Sub-soil drainage was resorted to for the purpose of carrying off ground water, when it rose to the level pipes were laid. Moisture ascended in houses by capillary attraction and showed itself on the walls of rooms. When it evaporated it would absorb the heat of the surrounding atmosphere, leaving the room cold, with perhaps a feeling of dampness which was often associated with the production of rheumatism, catarrh, bronchial and pulmonary affections, neuralgias, besides predisposing to diptheria, scarlatina, measles, and whooping cough. Pthisis or consumption was closely allied to moist soils, and this was markedly reduced in incidence when subsoil was well drained and efficient sewers were laid down. Marshy lands, which were the breeding places of the disease-carrying mosquito, were rendered healthy by drainage and the planting of trees—the latter by transpiration absorbing a lot of water. An oak tree would evaporate eight-and-a-half times the amount of rainfall over the area it covered. The eucalyptus globulus was the best tree to plant in marshy and malarious districts, because it absorbed eleven times the amount of rainfall over its area, and when mosquitoes were deprived of moisture they could not propagate, and micro-organisms could not exist without moisture.

If building was necessary in marshy districts, then houses must be erected on arches to allow air to circulate beneath; or, if made of wood, they should be built on piles. It was always better to fill in moist ground, and grass should be grown on the surface and kept closely cropped, all excessive vegetation being got rid of. Ground water should preferably not reach within 10 ft. of the surface of any site on which a house was to be built. The best means of draining the sub-soil was to use unglazed agricultural pipes laid

in trenches, filled in above with pebbly grave which allowed free percolation through the pipes and into their ends. These ends were not jointed but laid in apposition to each other and discharge took place into some ditch or stream, but never into sewers or house drains unless disconnected by a trap.

Excessive planting of trees was not good, because it favoured dampness by checking the evaporation of moisture, causing stagnation of air and cutting out the rays of the sun. They were useful as shelter from north and east winds. A south or south-east aspect for living and sleeping rooms was the best, and preferably on a gentle slope which favoured the natural drainage of the surface and subsoil water. Valleys lying in the direction of prevalent winds were drier and more healthy than those lying in other directions.

Houses without basements, when the site was not concreted over, should be raised two feet above the surface of the ground, and the intervening space ventilated by using ventilating bricks or having air grids in the outer walls. Foundations should always be protected from the access of water, otherwise they would be damp. There should always be a uniform bed for the foundation, and it should not be partly of gravel and partly of clay. Chalk foundations were not too good as cavities, &c., might lead to subsidence. Clay sites had a tendency to shrink and crack after prolonged drought; or they swelled or softened after much rain and thus injured the building.

Walls constructed of building bricks and mortar were very porous and could absorb large quantities of water. A brick would hold 16 ozs. of water and so prevent damp rising from the ground up a brick wall. A damp-proof course of slates bedded in cement or $\frac{1}{2}$ in. layer of asphalt, or slabs of perforated glazed stoneware, should be placed in the wall just above the level of the adjoining ground. We might have a layer of perforated bricks, which acted as a damp-proof course, permitting circulation of air under the floor, which would help to prevent dry-rot in timbers and joists. If damp-proof courses did not exist already, they could be inserted under old walls by removing a series of bricks piecemeal, after under-pinning the walls, and inserting perforated bricks in sections. Brick and mortar walls might be coated with cement to prevent dampness caused by driving rains. Where mortar became rotten, pointing with cement should be done after digging out the rotten mortar.

Damp walls might be temporary, as in new houses, due to evaporation of water from new bricks and mortar. They might also be due to damaged rain-water pipes or defects in gutters which allowed water to drip down the walls, soaking through bricks and mortar. Concluding, Colonel Probyn stated that on a future occasion he would deal with questions of ventilation, warming and lighting.

Southwark Cathedral Extensions.

The Bishop of Southwark proposes a scheme for reviving three chapels in the retrochoir or Lady Chapel of Southwark Cathedral.

Obituary.

We regret to record that the death occurred recently of Mr. James Forbes, architect, of Middlesbrough.

We regret to announce that Sir Hamo Thornycroft, R.A., sculptor, died at Oxford on Friday night, aged seventy-five. Among his works are the Boadicea group near Westminster Bridge; the national monument to General Gordon in Trafalgar-square and in Melbourne; John Bright in Rochdale; Lord Beaconsfield; Thomas Gray (the poet), for the hall of Pembroke College, Cambridge; the Cromwell statue at Westminster; Queen Victoria Memorial in Karachi; and the National Memorial to Gladstone in the Strand. Mr. Thornycroft, who was elected a Royal Academician in 1888, was also an honorary member of the Royal Academy of Munich, and received a Medaille d'Honneur at the Paris Exhibition in 1900. He was Knighted in 1917.

PHILIP WEBB AND HIS WORK.—XII

By W. R. LETHABY.

CAXTONS AND WHITE HORSE HILL.

To W. R. L., January 17, 1906.—“... If as you feel the thing's backbone is finance rather than righteousness, can anything you may hope for come out of it? Certainly I have my doubts, but then I've had a good many in my life, and some of them proved unsubstantial. I so truly long with you for some quite serious and substantially simple public buildings being set up in place of the usual unintelligent masses of Portland stone which have been done lately, and are still doing under Government ignorance... I have your volume of Venturi, which is a book of many wonders of delight to me.”

To W. R. L., May 29, 1906.—“... Oh, you should have seen the merry-go-round of *all* the apple trees in the fullest of full bloom *this* year. Even my lack of enthusiasm was stirred to tedious exclamations of joyfulness at this wonder of our earth. If Methuselah had the like every year 'twould account for his living so long. ... Green is a remarkable colour in these parts in May! I saw a *green* of pasture grass to-day so astonishingly powerful in conjunction with pure brown brick earth and still the two went together harmoniously.”

On June 12, 1906, he had a little outing in Kent with Mr. Hale White (“Mark Rutherford”)—the author of “The Revolution in Tanner's Lane,”—meeting him at Etchingham. In his sketch book are these notes: “The church of fine fourteenth-century work complete even in design. Local sandstone; central tower, no transepts; flying buttress-arches over aisles to tower. All the nave and aisle windows have best kind of painted glass in the tracery, of the same date as the building, except E. window of south aisle, where it has been taken away for the insertion of miserable modern memorial stuff. Masonry inside has had its surface destroyed by retooling, and the church generally (inside) has been dealt with by dull unsympathetic hands. Could not get up into tower; as entrance to stair turret is high up in chancel. Man in church said there was one bell, which he just sounded—of fine tone—which he asserted was inscribed of same date as church about 1365. Three brasses, two in choir and one in S. aisle of nave; to the Etchingham family, the earliest to the founder. Outside, the church is an upstanding piece of noticeably fine proportion and generally in good condition—rough ashlar-faced walls. On to

Burwash, about 2 or 3 miles west. Little of interest remains in the church except the Norman tower and shingled spire—very pretty this. There is a fourteenth century iron sepulchral plate in N. aisle of nave—said to be cast-iron. But to me it looked to be of malleable metal, with the cross and inscription raised by lowering the plain plate round it. About half-mile beyond Burwash in the lower ground, near the small stream, is a very interesting house of James I's time, in good condition. Large house faced with scabble-tooled local sandstone ashlar, brick chimneys, good large rooms. Some panelling of oak in several of ground floor rooms.”

To W. R. L., August 30, 1906.—“... Art cannot be created at will, it must be a discovery, and you would be likely to add that any advance on it would be another discovery which could not have been disclosed without its predecessor—and so on to infinity; which is altogether different to following a fashion as long as it will hold together. Of course, craftsmanship is a hard qualification for an architect in our own blind-guided days.”

To W. R. L., November 5, 1907.—“... And so poor old Bodley's gone away; hardly a surprise to me on learning of his killing journey overseas [to America] at his age—must have been three or four years older than me. He was a man of some taste and discrimination, and for a while I had at one time pleasure in his companionship; it died away under the ‘Restoration,’ separator of friendly familiarity, his respectability increasing and mine going—going—gone!”

June 28, 1907: “I rejoiced at your going to Italy and on to Rome. ... It laid hold of me, and in a way peculiar to itself and against reason in fact. Often the magical effect comes back when really other places in Italy have bigger claims from their beauty and surroundings. Middleton and I got on well together there in spite of my resisting his strange fanaticism in labelling the truly structural brickwork as a sham. To me it is undoubtedly a very important part of strength in combination with concrete. ... I never got to see that beautiful dome ruin misnamed Minerva Medica; its umbrella ribs of tiles must have been the cause of its keeping nearly whole. Giacomo Boni good-naturedly came down to

see me [at Caxtons]. He was affectionate as ever, and though he be as hard as nails* he was bright and free when here. This country of woodland struck him strongly.”

To W. R. L., February 8, 1908: “... The Brit. Mus. and S. Kensington retreats on Saturday afternoons have faded from my memory like an old and ill-fixed photograph so that my eyes get an old kind of gleam in them while turning over your pages. ... O, dear me, is there any hope of real invention in the design for the County Hall? There was a rough outline sketch in my *Tribune* [a daily paper of the time] “which might mean anything for there was no plan—the plan, the plan, and all the *plan* is all one's help for making out what the effect of such a building would be on the excellent site. ... It seems to me that this long thing as in the newspaper might do if the planning were good, and O, dear me again, the detail should not be of the commonplace. Architects in these days are given to that order of detail, ain't they? ... You see that I am a bit worn thread-bare in mind and body at 77, and perhaps the leafage of me is rather sere and yellow—never mind, I'm not over melancholy.”

March 11, 1908: “Now is the time for really designing it [the County Hall] and taking the competition parts out of it—holding like grim death on to those which have the salt of ‘design’ in them. ... Were you not content that S.C.C. should drop anchor in the Cam and give up roaming on the treacherous four seas? Why four?—the ‘Four Want Ways’ to be sure.”

November 2, 1909: “... My old and very dependable friend, Hale White, has had a bad time of it in his old age with operation to follow. He has been very low since. ...”

January 6, 1910: “... I can understand the feeling in rude tribes of beating their gods, as I can mine of calling Ruskin and Carlyle savages. ... I am believing that the shaking of the British constitution now going on will do that venerable but just now besotted institution a refreshing good.”

To W. R. L., September 19, 1910: “... Cards of Alfreton have stirred the pool of indolence and made me wish to see the place before it is too late. I'm not quite sure if ever there was a spire set down on its tower with greater refinement than that example of conjunction. Who knows but that I might borrow an aeroplane and circle round the weather cock. I forgot to post the above written yesterday, and now I am touched by learning from Mrs. [Wickham] Flower that George Wardle died at a nursing home in Plymouth, September 11; he had been living at Fowey, in Cornwall, the last year or two. I had great regard for him and his remarkable abilities.”

In 1911 he went to Rottingdean to see Lady Burne-Jones, and also to Groombridge to visit Mr. Hale White.

To W. R. L., January 22, 1912: “I much want steadying in old age; for example, my memory fails and leads me into ugly bogs.”

This summer, however, he was wonderfully himself and he came to London twice. On May 10 I met him, and we went together and saw Watts's bronze *Physical Energy*, which he admired, remarking that Watts knew about horses and rode very well; then we walked on to Kensington Museum.

To W. R. L., June 22, 1912: “I cannot explain how I have so almost wholly forgotten London and Kensington Gardens. ... Do you know anything of Oliver W. F. Lodge who has boldly stepped in, and backed up, the otherwise unknown William Morris with a not-so-bad lecture he gave at Birmingham? I had almost to hold my breath as I read lines of the Great Fellow whom we know! I at once got the big book down of the gigantic Sigurd—Ah. Yes.”

September 14: “... I am minded that Sta. Sophia is in danger; I hope exaggerated by the carrion crows hovering over it.”

To W. R. L., November 1, 1912: “The last visit to London was alone. Walked from

Lion at Dawn. Pen Drawing, 1867.

* This said in admiration of his intellectual keenness

Victoria Station across the Park to Marble Arch, which was being signficanted, and noticed the certainly improved Wellington Arch, with its horses and wings triumphant, and did not look amiss to me some distance off. To get towards home I walked from Marble Arch east, all along Holborn to Paul's and London Bridge direct to station and came home."

Mr. Jack tells me of other London visits. "He usually began at the watchmaker or shoemaker or other dispensers of common comforts. All the shops he visited were of an old-fashioned kind—that ordinary mortals don't as a rule enter. His watchmaker was up a turning off, I think, Threadneedle-street, in a little square, and the shop had only one or two fine watches in the window. The shopkeeper greeted him in a friendly way. After a good gossip they came to business, and W. left for some other shop. His bootmaker was somewhere near the British Museum, and did no business in ready-made things. I remember once things in the boot way had 'gone up,' and his poor purse had gone down. He had sorrowfully to say he could not have his periodical pair of shoes. He went to another shop where ordinary mortals get their boots. He loathed anything that had the remotest taint of shoddy, and would rather do without his snuff than cut down good necessary things. This reminds me of the excited way he used his snuffbox when on the 'jobs'; he would talk to the foreman, explain and expostulate, continually shovelling up snuff. Poor old chap, he cut off one box a week at Caxtons, then both, and did without. When the shopping was done we had some tood, then after a prow to see any new thing, we wound up at St. Paul's. It was inspiring to see his heartfelt enthusiasm for the work of a man whose form of expression was so opposed to his own. His criticisms were generous; he lost all thought of 'style,' but he enjoyed the romantic abandon of Wren's compositions when compared to the pedantic stuff which goes by the same style name. For Wren's abrupt changes, his spontaneous introduction of inventions of his own and for all creative experiments Webb had the profoundest admiration and sympathy. It was now time to go home. Once we went from Charing Cross to London Bridge by boat, and I shall not forget his delight at the sparkle of the water under the Bridge (all the visits were on fine days), he was quite boyish. We had barely time to catch the train, and took a 'Hansom,' a thing he never did of his own account, and it added a touch of wickedness which made it a red-letter day.

"He disliked to have more than one visitor at a time. One day Weir and I walked from East Grinstead without any warning. He was on a ladder, putting up boards, and said abruptly, 'Go home, who asked you two villains to come here?' then came down and made the best of it by giving us a nice tea.

"In his later years of office work he seemed to be depressed and easily irritated by his work. When he got into the country free from the routine, he recovered quickly, and regained his old restfulness of mind. Talking at Worth, I happened to say that I felt the power of Gothic buildings mostly in the smaller ones, especially certain village churches. We agreed that where a whole building is considered, the smaller ones were oftener perfect, the greater ones being marred by official ambition and interference. In looking through some old letters I was struck by his reference to 'that invaluable madman of Coniston.' He always spoke in this way of Ruskin—high respect for the man and humorous acceptance of his extravagance of expression."

To W. R. L., Jan. 27, 1913: "... The thrushes are just tuning their instruments, these one or two early days of promise. ... I am got to be so old that I am tedious even to myself. ... I had thought that the old and trustworthy friend, Norman Shaw, would have held on as long as myself, but no. And he had done good and serious work."

July 2: "... George Jack came to see us last Saturday—good and helpful over the roughs of time, always. The weather here looks as if it would hold out to the end of the week, when

the hay-harvest will be ricked in and finished."

October 7, 1913: "... You have sent cards with pleasant things on them which have helped me out of myself, the last being the great circle of stones of South Avebury. Bless me! and you had not forgotten that our Morris had been together with me, which was no small thing, and those Marlborough days with Kelmscott, &c. I am somewhat down in the mouth now, from the discomfort of my memory having failed me to keep company with 84 or 85 years on this earth—if so be. The harvesting was fine this year and ricked easily and well."

February 25, 1914: "... The weather lately having been too savage in its winter's tail I dared not ask you to come, but to-day has been beautiful."

"Caxtons, July 24, 1914: Dear Friend,—Please to come on Saturday by train as you note, and cheer me, and see the yellowing cornfields.—PHILIP WEBB."

On one of the last walks I went with him, it may have been at this time, he called attention to "the rustic delicacy" of a cottage home we were passing—a phrase illuminating the sort of things he cared for.

He remained courageously strong up to the time I saw him last, in November, 1914, but was afflicted with gloomy horror by the war that had "broken out." Even at this time, he insisted on walking part of the way to the station with me in the dark. On one of these walks at Christmas-time, he fell, and we heard from Mrs. Dickinson: "He does not sleep, but keeps talking and laughing, and all the time wanting to go home"—that was to Oxford. This wishing to go home to Oxford became so insistent that Mr. Walker went with him part of the way, but they had to turn back.

Mr. S. C. Cockerell writes: "He continued to receive his friends, myself among the number, and to talk of old times until his death, at which I was present, on April 17, 1915. On July 10, Emery Walker and I scattered his ashes on the wind-swept turf of the White Horse Hill in Berkshire, a spot very dear both to himself and to Morris. Morris once declared that he was the best man that he had ever known, and there are very few of those who were privileged to know him who would not say the same."

In writing to a friend whom he introduced to Webb in 1903, Mr. Cockerell used some words which must be quoted: "I am delighted that nothing interfered with your visit to Philip Webb and that you came away refreshed. He is the most valiant and strenuous man I have known, a man who has never done the smallest thing with less than his might, and who has continuously despised both money and fame, when he might have had both by swerving ever such a little from the narrow path along which he has travelled. The high aim that he set before himself as a young man has led to a degree of success that very few men have attained to—though it is not of a kind to be measured in guineas." Mrs. Dickinson tells me: "I consider the fifteen years I was with him the best spent of my life; I can always see his happy face." Mr. Jack says in a letter: "Webb's life was remarkable for its harmony, the unrest which makes history seldom appeared; he seems like something for private circulation only." I will not add any formal words to these accidental expressions of reverence for a great man. It was by his own wish that no memorial stone was set up and he did not possess any portrait of himself.

A little while ago the writer asked a contemporary of Webb if he had not known him: "Yes a little; I had some correspondence, with him—very eccentric; from some Socialist sort of ideas he would not invest enough money and then nearly miscalculated how long he would live." That I suppose must be the final verdict—"Very eccentric!"

Sometimes, however, when I am a little disappointed with professional architecture and formal art teaching, the thought comes with comfort that the existence of Ruskin, Morris and Webb must have had some meaning.

In an earlier chapter I have tried to summarise what were the architectural movements, eddies and stagnations when Morris and Webb came to

London. I should like now in a few final words to suggest how far their influence has reached in our own time and to question our hopes and fears for the future.

Mr. George Jack writes of Webb: "Of direct and recognisable imitation of his work there has been very little, but of a subtle, permeating influence due to it there has been a great deal. The wholesome change from vulgar and ostentatious display of sham costliness, or the dullness of mere utilitarian house-building, to a free use of homely material, notably rough-cast and whitewash, is directly attributable to Webb's influence. His use of these materials has been parodied, but nevertheless it is a step forward, from a vulgarity of vice to one which is more or less innocent. None but those who are well acquainted with his work can form an idea of the deep impression which it makes when studied. When seen for the first time it may be a kind of a shock to conventional ideas, but—this passed away—the way is open to sincere admiration and reverence. Admirable as is the work he actually did, and deep as was his influence it was little compared to what lay in him to do and to teach. Philip Webb was in essence a spark of the creative spirit. He was, before everything, a born craftsman, and might have been a great master builder and sculptor, but he found himself imprisoned in an "office" with no other use for his hands, with their unappreciated cunning and skill, than to make heart-breaking attempts to convey his ideas of design and execution through the irritating medium of a lead pencil. The way in which he turned this pencil into a fairy wand, and by its means dealt with so many crafts at second-hand and at a distance, is little short of a miracle. Fairy wands of this kind are not transferable and Philip Webb was probably the very last architect who could design buildings in the Gothic spirit, true to facts of construction, true to ideas of beauty founded upon love of noble living, and true to himself, however conscious of hampered hands and a narrow field. There is compensation in the fact that such a man has lived his life among us."

Webb's contemporaries already began to learn of him; Norman Shaw knew him well. I have already mentioned his admiration and there are many Webb traces in his earlier work, notably in Lowther Lodge. Robson, the designer of the first School Board buildings in London (after 1870), obviously drew largely from a study of Webb's results; he had some connection with Warrington Taylor in the days of the Morris firm, and must have known Webb personally—indeed, all architects know one another in a way. The best of these buildings are largely common-sense brick structures, with little stylistic pretence. E. W. Godwin also knew Webb, and must have been influenced by him. Bentley, the gifted architect of the Roman Catholic Cathedral at Westminster, certainly admired and was affected by Webb's work. I happen to know that some time before his death Bentley, doubting whether he would live to complete his beloved Cathedral, called on Webb to ask if he might recommend him to finish the work in case of his own death. Webb explained that he had nearly come to the end of his strength, and that it could not be. He sympathised very fully with Bentley's fine effort. A few months before he died, Thomas Colcutt, another architect of Webb's time, told me: "I only met him twice, to my great loss, but I heard a great deal of him and know intimately some of his work, for which I cherish great admiration. There were three men in my earlier days—Webb, Nesfield, Shaw—all of whom I thought in the forefront of their generation. I remember being impressed by the lofty view held by Webb of the calling of an architect."

The whole modern arts and crafts development had its origins and implications in the ideals and experiments of the Morris firm. There is in this a general lesson of the uses of group work which it is desirable for all artists clearly to see. Art is essentially a social activity and it requires incessant cross fertilisation. No one individual is sufficient ground for it to spring from and flourish. The members of the Morris group seem to have been the first among modern educated and well-to-do people to feel the

impulse towards workmanship. There is probably something significant in this and in the further fact that many other men have been impelled to follow them in trying to *do* something. Perhaps it is, and I hope it is, a reaction in the very nature of things against what has seemed the irresistible steam-rolling of machinery—but the days are too few to say.

As time goes on Webb's work affects a wider and wider circle, and thousands of buildings, even the small houses erected under various housing schemes—mere rational structures, but pleasant—carry on the impulse. Indeed, I may venture to say that every piece of building work done in England during the last generation which has any life in it, is either the direct, if bungling, attempt of some practical builder, or it derives in some way from the experiments of Webb. Any work that has a soul of good in it must have been thought of, not as architectural style and grandeur, but as sound and expressive building—there is no persistence in anything else.

THE WEEK IN PARLIAMENT

WESTMINSTER, Wednesday.

Town-Planning Schemes.

Lady Astor asked how many town-planning schemes had been approved in England and Wales, respectively, since January 1, 1920, and how many local authorities in each country had carried out the statutory procedure preliminary to the actual preparation of such schemes.

Mr. N. Chamberlain said that the required particulars were shown in the following table:—

From January 1, 1920, to December 1, 1925.	England (excluding Monmouth).	Wales (including Monmouth).	Total.
Number of Town-Planning Schemes finally approved ..	9	..	9
Number of other Town-Planning Schemes submitted for approval	11	..	11
Number of Preliminary Statements of proposals approved for inclusion in Town-Planning Schemes..	62	..	64
Number of other Preliminary Statements submitted for approval	55	..	60
Number of Local Authorities with Schemes or Preliminary Statements approved or submitted for approval	88	..	90
Total Number of Local Authorities now formally engaged in the preparation of Schemes.....	292	..	310

Demonstration Houses.

In reply to a number of questions as to the special subsidy given to houses other than those built of brick in Scotland, Sir J. Gilmour, Secretary for Scotland, said that the final selection of types of houses was made after careful consideration of all the relevant facts, and the Atholl house, among others, had to be ruled out on the ground of cost. The basis on which the rates per foot of superficial area were arrived at varied inversely with the size of the house, because certain fittings were common to all sizes and were not appreciably affected by an increase in superficial area. With regard to the Corolite house, he was advised that the roof as tendered for was satisfactory. It was correct that the inclusion of additional items would increase the cost of Corolite house, but he saw no reason for insisting on these.

Asked by Dr. Shiels whether the Scottish Board of Health was bringing pressure to bear upon different municipal authorities in Scotland to persuade them to accept one of the four types selected for the special subsidy after certain authorities had intimated their unwillingness to accept either of the types in question and expressed their preference for other types, Sir J. Gilmour said he was bringing no pressure to bear on Scottish local authorities in favour of any particular type. He was, however, doing his utmost to induce them to co-operate in the provision of additional housing by alternative methods, but it must be clearly understood that an essential factor in such schemes must

be the provision of a house at a rent within the reach of the mass of the population.

St. Stephen's Hall.

Sir M. Conway asked whether, in view of the approaching completion of the mosaics in St. Stephen's Hall, there was any probability of carrying to completion the general decoration of the Hall.

Captain Hacking, replying for the First Commissioner of Works, said that thanks to the generosity of a number of Parliamentarians, a scheme was well under way for the decoration of St. Stephen's Hall by a series of paintings of scenes in British history. Eight artists, under the leadership of Sir David Cameron, R.A., were now preparing sketches of the pictures which would eventually be placed in the panels of the Hall. The subjects of these had been selected by Sir Henry Newbolt, in consultation with the painters, and with the approval of the First Commission, the Chairman of the Royal Fine Art Commission, and the Speaker, to whom the preliminary sketches would shortly be submitted.

The Government's New Housing Policy.

SCOTTISH SUBSIDY WITHDRAWN.

On the motion for the adjournment of the House of Commons on Friday, Mr. T. Thomson, a Liberal member, called attention to the housing question, and complained that the position to-day, so far as the shortage of houses was concerned, was no better than it was in 1919. At the present rate of building it would be at least ten years before the shortage was wiped off. He also urged that the Government should launch a great crusade against the slums.

After several other members had taken part in the debate, Mr. N. Chamberlain, the Minister

authorities had submitted 92 schemes, of which 83 had been confirmed. They were moving faster in this respect now than at any other time in history. An enormous number of repairs, alterations, and renovations to the slums were also going on all the time under the Act of 1890. In the last year for which complete figures were available, 1923, 256,000 houses were made habitable after the serving of statutory notices by local authorities. To that must be added another 253,000 houses which were rendered fit in consequence of informal notices. In a single twelve months 512,987 urban and 49,520 rural houses had been put into habitable condition. He did not feel he could refuse to assent to the erection of blocks of high flats in crowded areas, although he might personally object to them as not being the ideal thing. The problem of the slums was not only a matter of bricks and mortar; it was a social problem. In order to make more rapid progress in ameliorating slum conditions, it might be necessary for local authorities to be given the power not merely of compulsorily acquiring slum property, but of holding it until such time as they were ready to reconstruct it on properly considered lines.

Surprising progress had been made in building houses in rural areas. Since 1919 the total number of houses built in rural districts was 161,460, of which about 39,000 were built by local authorities and 122,000 by private enterprise. The question as to whether houses as they stood could be improved on so that they could be added to the common stock of agricultural houses was receiving very close attention from him, and it was one on which he might be able to devise some scheme. Under the 1924 Act he was bound next October to review the conditions of the subsidy given under both Acts. Apparently a mistaken impression had arisen that the Ministry would not guarantee any subsidy on any house which was not completed on October 1, when the revision took place. It was quite obvious that if that were so, there would be a gradual drying up of the placing of new contracts. No such proceeding as had been suggested was contemplated. If any house was substantially started by October 1, that house, if it was part of a scheme already approved, would be eligible for the subsidy.

In conclusion, Mr. Chamberlain referred to the success that had attended the mobilisation of the forces of private enterprise, and in congratulating the building industry, he included the manufacturers of material, who had enormously increased the supply.

Later in the debate, Mr. Baldwin, the Prime Minister, dealt with the gravity of the housing situation in Glasgow and throughout Scotland, which he described as a "national scandal." Under the 1923 Act, in the last 13 months, only 426 houses were built in Glasgow as compared with 2,550 in Birmingham, and under the Wheatley Act 18 houses were built in Glasgow as compared with 1,839 in Birmingham. The total during that period, including replacements of certain cleared slum areas, was 1,100 houses in Glasgow and 4,389 in Birmingham. For some reason or other the offer of the £40 special subsidy which he made in September at Glasgow had failed, and that being so, he had to announce that that special subsidy scheme lapsed "here and now." "But," proceeded the Prime Minister, "of course we cannot leave it like that. The local authorities have not seen their way to take up this offer, and we must proceed ourselves. We intend, therefore, to proceed forthwith with the erection of 2,000 houses by alternative methods. We propose, in the first place, to utilise the Scottish National Housing Company. We will finance the development, and we will take every step to secure its accomplishment.

Sir J. Gilmour, Secretary for Scotland, said they would probably proceed by giving an order for 1,000 houses to the firm of Messrs. Weir, who could give early delivery. Rapidity of construction was another fundamental part of the scheme. The Atholl house had been ruled out on account of price, but if the Duke of Atholl could bring his prices down the Government would be glad to do business with him.

The motion for adjournment then lapsed.

of Health, agreed that the idea of demonstration houses had been a failure because the building industry had deliberately set itself against the adoption, even, of demonstration houses, and they had gone so far as to threaten any local authority which put up even a pair of houses, so that people might see what it was which was being offered, that the whole labour would be taken off on houses of any other type. Had it not been for the opposition of the trade unions and the employers in the building industry, these demonstration houses would have been erected in a great number of places, and once people had seen the kind of thing they were they would have insisted on having them. If they were not going to have new methods they must wait longer for the houses. If they wanted houses at once they had better try new methods.

Dealing with the number of houses built, Mr. Chamberlain said that in the five-year period ending 1904, the "peak" period of house building in this country, the average number built in England and Wales per year was 116,370, of all kinds of houses. In the years 1905-1909 the number was 102,706, and in the next five years, 1909-1914, the average dropped to 60,648. If one compared that with the 159,000 odd houses built this year, and if one remembered that the latter represented a gradually rising figure, then there was something to take heart about. They did not require any fresh legislation now to get houses. They were also making some progress in regard to slums. In the 24 years from 1890 to 1914, only 43 local authorities put forward 71 schemes; in the six years 1919 to 1925, 71 local

LEGAL SECTION

NOTES ON CURRENT CASES

The Liabilities of Landowners.

Two cases at present only briefly reported in the *Weekly Notes* illustrate the liabilities of landlords and landowners. The first case was *Booth v. Thomas* (*Weekly Notes*, November 28, 1925). It related to a certain site which in 1875 belonged to one Davies, which consisted of a slag heap, through part of which ran a natural stream. To the east of this site was a footbridge, and in 1878 the Local Board had taken away this bridge and culverted the stream, and conducted a road over the culvert. The site could not be used for building unless the stream were culverted, so in 1879 Davies had culverted the stream from this road to the west for twelve yards, and at some later date to the limit of his property, and in 1886 erected a building about 2 ft. from the culvert and had leased the building and that portion of the land to certain persons for a term of 99 years. In 1904 this lease had been assigned to the plaintiff in this case, and the land retained by Davies and the reversion in that portion the subject of the lease had in 1907 become vested in the defendant. The lease provided that the building should only be used for religious worship, and it contained an express covenant by the lessor for quiet enjoyment. The southern wall went 4 ft. into the slag heap, but did not reach the natural soil, and on December 22, 1923, during a severe storm the brook broke through the side of the culvert and washed the slag away from the southern wall so that it collapsed. The storm was not so exceptional that the bursting of the culvert could be attributed to *vis major* or the act of God, but the culvert had never been repaired and was in bad condition. The culvert was on the land retained by the original lessor now vested in the defendant.

The plaintiff claimed damages and relied upon the covenant for quiet enjoyment; he also alleged that there had been a derogation from his grant; and thirdly, relied upon the principle laid down in *Rylands v. Fletcher* (1868 L R 3 H L 330), which relates to persons bringing a dangerous element upon their property.

The defendant, in defence, alleged that he had done no act of commission, and the omission to keep the culvert so that the water could not escape was not a breach of the covenant for quiet enjoyment.

The Court did not consider the third ground of claim, *Fletcher v. Rylands*, because it held the plaintiff entitled to succeed on the two first grounds, which stand or fall together. The learned judge held that the covenant for quiet enjoyment might be broken by an act of omission if it were the omission of a duty (*Cohen v. Tannar*, 1900, 2 Q.B. 609 per Lord Justice Vaughan Williams; *Hargroves, Aronson & Co. v. Hartopp*, 1905, 1 K.B. 472; *The Builder*, February 4, 1905), but in this case the defendant had done an act of commission by confining the water in an artificial structure incapable of retaining it. We may point out that it was the defendant's predecessor in title who had actually confined the brook in the culvert, and the defendant had been guilty of non-repair. The case at present is very shortly reported, and we do not know if anything turned on this point. But, in any case, it would only affect the subsidiary finding that there had been an actual act of commission. Somewhat similar questions have arisen in connection with flats where the landlord retains control of part of the premises, and an example of such cases will be found in our note to *Cockburn v. Smith* (1924, 2 K.B. 119) in our issue, August 29, 1924. *Hargroves v. Hartopp* was cited in that case.

The second case we referred to is *Clayton and Others v. Sale Urban District Council* (*Weekly Notes*, November 28). In this case

the Urban District Council had proceeded under Section 94 of the Public Health Act, 1875, against the appellants, who were owners of land adjoining the River Mersey to abate a nuisance caused by a breach in the flood bank on the appellants' land which made the water flood neighbouring land. In this case the land on both banks of the river was protected from it by artificial flood banks constructed of earth, clay, stone, gravel, etc., to a height of about 12 ft. above the normal level of the river, but these banks had been constructed so long ago that no record could be found of their construction. Before the water reached the appellants' land large quantities of sewage and industrial effluent passed into it. Other riparian owners repaired parts of the banks on their land, but the bank on the appellants' land was out of repair, and in February, 1920, during a heavy rainfall, the bank had given way, causing some 349 acres of adjoining land to become flooded. The breach in the bank had gradually increased in size until at the date of the hearing (12 November, 1925) it was co-terminous with the appellant's land and the flooding caused a nuisance.

The appellants contended that they were under no obligation either at common law or by statute nor by agreement to repair the bank; that the nuisance did not "arise or continue their act, default or sufferance" within the Section; that the flooding was not caused by the flooding of their land, and they could not be ordered to repair the said breach, as to carry this out they would have to trespass on land not belonging to them.

The justices had found that the nuisance was caused by the act, default, or sufferance of the appellants in failing to repair the said breach, and in suffering it to remain unrepaired, and they ordered the appellants to repair the breach by reconstructing the bank on their land.

The Court affirmed the justices, holding that the appellants' contention that as there had been no agreement by the appellants there could be no default on their part in failing to maintain the bank was erroneous. The section referred to default or sufferance in reference to the particular nuisance, and that could impose a liability apart from agreement. This case is also at present only shortly reported. It may be of interest to see how far, if at all, the new Public Health Act, 1925, will bear upon the questions raised in these two cases.

As regards the first case, where a stream had been culverted by the predecessor of the defendant, Sections 51, 52 and 53 will have a distinct bearing on such cases in the future, and they occur in that part of the Act which is adoptive.

Section 51 relates to land laid out for building and enables the urban authority, if in their opinion any watercourse or ditch situated upon such land or upon which such land abuts requires filling up or covering over, to call upon the owner, before any building operations are begun or proceeded with, to execute such works as may in their opinion be necessary for effecting the objects aforesaid or for substituting for the watercourse or ditch a pipe drain or culvert with all necessary gullies, pipes, and means of conveying surface water through the same. Subsection (2) imposes a penalty and subsection (3) provides that nothing in this section shall authorise the urban authority to require the execution of works upon land in other ownership or which without consent shall prejudice the rights of any person not being the owner of the land.

Section 52 will have even a more direct bearing upon such cases as that we first noticed above, where the owner had culverted part of the

stream, for it provides that in urban districts it shall not be lawful to cover over or culvert any stream or watercourse except in accordance with plans and sections approved by the urban authority.

Section 53 also bears on that case, as it enacts that the owner or occupier of any culvert situated in an urban area shall from time to time repair, maintain and cleanse the culvert, and if any owner or occupier fails to comply with the requirements of a notice served upon him, requiring him to execute such operations, the urban authority may execute such works and recover the expenses as a civil debt.

As regards the second case, which related to the artificial banks of a river, it is doubtful whether Section 54 would have any application to that case. It provides, as regards watercourses, for exactly what occurred in that case, but not in respect of a breach in the bank. "Any part of a watercourse which is situated within the district of an urban authority and is so choked or silted up as to obstruct or impede the proper flow of water along the same, and thereby to cause or render probable an overflow of the watercourse on to land and property adjacent to the watercourse or to hinder the effectual drainage of water through the same shall be deemed to be a nuisance within the meaning of Section 91 of the Public Health Act, 1875, notwithstanding that the same may not be injurious to health."

This section has no application to a watercourse ordinarily navigated by vessels employed in the carriage of goods by water.

Although this section may have no application to the above case, the decision delivered in that case may have application to this section. The section contains a proviso "that nothing in this section shall be deemed to impose any liability on any person other than the person by whose act or default the nuisance arises or continues," and is narrower than Section 94 of the Public Health Act, 1875, under which proceedings for nuisance are taken, for under that section, if the person by whose act, default or sufferance the nuisance arises cannot be found, notice can be served upon the owner or occupier of the premises on which the nuisance arises.

In *Clayton's case* (*ubi sup.*), however, it was held that the person who allowed conditions to arise which caused a nuisance was a person by whose "act, default or sufferance" the nuisance arose, quite apart from any agreement or undertaking in relation to the property. Therefore to this extent that decision appears to bear upon this section. It is to be noted that in Section 54 the word "sufferance" has been omitted; this may make no difference in the effect of the section, but where statutes have been the subject of a long course of decisions we think it is unfortunate that the terms should, as in this instance, be unnecessarily altered, as it encourages litigation to ascertain the distinction, if any.

The Public Authorities Protection Act.

The case of *Huyton and Roby Gas Company v. Liverpool Corporation* (*Weekly Notes*, November 28) should be noted, as it decided an important point under the Public Authorities Protection Act, 1893.

The Corporation, acting under a special Act which incorporated the Waterworks Clauses Act, 1847, relating to the breaking up of streets, had laid a water main in certain roads in which were gas pipes belonging to the plaintiffs. Section 32 of the Waterworks Clauses Act contains provisions requiring the undertakers, when they open or break up a road, with all convenient speed to complete the work for which the road is opened and "fill in the ground and reinstate and make good the road."

The defendant Corporation, when filling in the trench they had made for their main, had neglected to ram the earth sufficiently, and the

gas pipes were left without sufficient support, and owing to subsidence of the soil sustained a series of fractures in the months of June and December, 1923, and July, 1924.

On December 12, 1924, the action was instituted, and the defendants in defence set up the Public Authorities Protection Act. Section 1 provides: "Where after the commencement of this Act any action . . . is commenced in the United Kingdom against any person for any act done in pursuance or execution or intended execution of any Act of Parliament or of any public duty or authority, or in respect of any alleged neglect or default in the execution of any such Act, duty or authority (a) The action . . . shall not lie unless it is commenced within six months next after the act, neglect or default complained of, or in the case of a continuance of injury or damage within six months next after the ceasing thereof."

The Court of Appeal, affirming the Court below, held that under Section 32 of the Waterworks Clauses Act there was a continuing duty upon the defendants to remedy the neglect in the improper filling in of the trench, and thus there was "a continuance of injury or damage" under the above paragraph (a), and all the damage sustained could be recovered, including that which had been sustained more than six months before the action was instituted.

The operation of the Public Authorities Protection Act appears inequitable in cases of personal injury as compared with cases such as the above. In the same number of the *Weekly Notes* will be found a case where a man injured by a motor car, owing to the negligence of the medical officer who had treated him in the workhouse infirmary to which he had been taken, had become permanently affected, a dislocation not having been discovered, but an action was held barred which was commenced more than six months after he had left the doctor's care.

Similarly in *Williams v. Mensey Docks and Harbour Board* (1905, 1 K.B. 804; *The Builder*, May 13, 1905), where a man had sustained injuries through the negligence of the defendants but had survived two years and then died, an action by his widow under Lord Campbell's Act was held barred because the right of action by the deceased himself would have been barred by the Public Authorities Protection Act. Both these are decisions of the Court of Appeal.

The distinction between the two classes of cases is obvious; in the case we have first considered, the duty was held a continuing duty, whereas in the personal injury cases the negligence is a single act, although the consequences may be continuous. The distinction in law is clear, but so is the inequitable operation of this Statute.

THE RENT ACTS: DE-CONTROL

A DIVISIONAL Court, but constituted of two Lords Justices of Appeal, has given an important decision in the case *Dunbar v. Smith* (the *Times*, December 15), on section 2, sub-section (1), of the Rent Act, 1923, which de-controls houses when a landlord comes into possession. The sub-section is as follows:—"Where the landlord of a dwelling-house to which the principal Act applies is in possession of the whole of the dwelling-house at the passing of this Act, or comes into possession of the whole of the dwelling-house at any time after the passing of this Act, then from and after the passing of this Act, or from and after the date when the landlord subsequently comes into possession, as the case may be, the principal Act shall cease to apply to the dwelling-house: Provided that, where part of the dwelling-house to which the principal Act applies is lawfully sublet, and the part so sublet is also a dwelling-house to which the principal Act applies, the principal Act shall not cease to apply to the part so sublet by

reason of the tenant being in or coming into possession of that part, and if the landlord is in or comes into possession of any part not so sublet, the principal Act shall cease to apply to that part, notwithstanding that a sub-tenant continues in or retains possession of any part by virtue of the principal Act."

The case came before the Court on an application to apportion rent. In or about August, 1914, the rooms on the first floor had been let to one of three separate tenants of various floors in the house, the ground floor and top floor at that time having been continuously let to two other separate tenants. In November, 1923, the first floor became vacant, and the owner, the defendant Smith, who was treated as "owner" by the Court, went into possession and did some repairs, and then re-let the floor to the applicant in this case.

The County Court Judge appears to have held that the sub-section did not apply because the landlord was at no time in possession of the whole house after the Act came into operation.

On the Appeal the Court pointed out that there could be no question of apportionment in this case, for this floor had been a separate dwelling-house ever since the Acts had come into operation, with a separate standard rent, and this really sufficed to dispose of the case, but applying the sub-section to this case, the Court held that the County Court Judge was wrong in holding that the whole structure must come into the possession of the landlord:—"The whole scheme of the Rent Acts contemplated one structure comprising more than one dwelling-house, and the words in the sub-section 'the dwelling-house' and 'a dwelling-house,' had a similar meaning. Thus the Court held that the plaintiff had come into possession of a dwelling-house within the meaning of the Acts, and it was de-controlled.

The case is at present only shortly reported, and it appears to us it must be read with considerable caution. It will be seen that this structure was, in fact, divided into separate dwelling-houses before the Rent Acts applied, and therefore no question arose as to its having been a single dwelling-house within the Acts, as in *Woodward v. Samuel* (*The Builder*, Feb. 27, 1920); or subsequently reconstructed into separate dwelling-houses when the difficult questions raised in such cases as *Abrahart v. Webster* (1925, 1 K.B. 563; *The Builder*, August 14, 1925), and *Barrett and Evans v. Hardy Brothers* (Alnwick), Limited (1925, 2 K.B. 220; *The Builder*, August 28, 1925), as to conversion arise. Where the building has once come within the Rent Act, then the difficulties begin, as was shown in those cases as to whether the house has since lost its identity as first laid down in *Sinclair v. Powell* (1922, 1 K.B. 393; *The Builder*, April 28, 1922). We only desire in this note to caution our readers from accepting this case as applying where such considerations arise.

There have been very few decisions on this sub-section, but in *Hall v. Rogers* (*The Builder*, April 17, 1925) the question was discussed as to what would amount to "coming into possession."

LAW REPORT

Death from Falling Ladder.

A claim under Lord Campbell's Act of the Fatal Accident Act, was heard in the Southwark County Court, recently, before Judge Sir Thomas Granger and a jury. The plaintiff in the action was William John Rutter, of 145, Northcote-road, Clapham Junction, S.W., and he claimed damages for the loss of his wife, due, he alleged, to the negligence of the defendants, Messrs. Hall, Beddall & Co., Ltd., builders and decorators, of Pitfield Wharf, Waterloo-road, S.E.

Counsel for the plaintiff, in opening the case, said that the claim was under what was known as Lord Campbell's Act, which enabled persons who were dependent upon certain deceased persons to claim for damages if it could be proved that the death of the person was due to the negligence of the defendants. In the case that was before the Court, the plaintiff alleged

that his wife met her death through the negligence of the defendants. He said further that his wife was one of the supports of his old age, and he was therefore, in a measure, dependent upon her earnings. Mrs. Rutter was employed by Messrs. Staggs & Mantle, of Leicester-square, where she had been earning 34s. 2d. a week as a dressmaker. The deceased woman died as a result of a ladder, which the defendants were hauling up, falling down and striking her. The ladder was over 60 ft. in length, and he submitted that the ladder was not being hauled up with proper skill and with proper appliances, and that it was wrong that ladders should be pulled up in such a busy thoroughfare as Leicester-square without giving pedestrians underneath warning.

The plaintiff gave evidence and bore out counsel's opening statement.

William Crookshank, in the employ of Messrs. Staggs & Mantle as doorkeeper, said he witnessed the accident. He warned Mrs. Rutter of the danger of passing under the ladder, but the defendants should have had a man there or in the roadway. The ladder was on the footway, and was raised and dropped when the deceased woman passed under it.

Further evidence submitted proved that the rope used was frayed, but it was contended for the defence that the rope had been put to the test of 900 lbs.

The jury returned a verdict for the plaintiff for £1 a week for six years—£312. Judgment was accordingly entered for the plaintiff for £312, and costs.

CHANCERY DIVISION.

(Mr. Justice Astbury.)

Infringement of Trade Description.

Courtrai du Nord Tile Co. v. Dennis, Ltd.

ON December 15 Mr. Hunt Mond, on behalf of the plaintiffs asked for an injunction to restrain the defendants from using the description *Courtrai du Nord* in connection with their tiles. He said that the defendants were willing to submit to an injunction as claimed and to deliver up any tiles as to which complaint was made.

Counsel for the defendants assented, but stated that his clients had accepted no orders for these tiles.

Mr. Justice Astbury made an order as agreed between the parties.

MANCHESTER SOCIETY OF ARCHITECTS.

Mr. Guy Dawber, P.R.I.B.A., at the recent annual dinner of the Manchester Society of Architects, appealed to members of his profession to aid the movement to preserve the amenities and old-world charms of our towns and villages. It was terrible to see the charm of our villages spoiled by ugly motor garages, with great blank sheets of glass and their trade signs and symbols. The whole countryside was being littered with architectural horrors in the shape of small houses built of inferior materials. They did not want State control, but the time had come when some authority should be constituted in each district to prevent that kind of thing happening. It was largely due to work being put into the hands of ill-trained architects and of local officials who had not had the proper training and who had no local sympathies.

The Lord Mayor of Manchester (Councillor M. E. Mitchell), said large buildings, eight, nine, and ten storeys' high, were being erected in the centre of the city, thus causing a greater congestion of people in the central area, and adding difficulty to the Tramway Committee's problem. If this tendency, for which architects were partly responsible, were to increase, the Corporation would have to face the question of widening the streets to accommodate the growing traffic. The City Surveyor's department had been authorised to prepare a kind of civic plan of the centre of the city, in order that the Corporation should know what was happening and where present-day tendencies were leading. If the architects of Manchester would give special consideration to the town-planning side of their work, he was sure they could help the administration of the city very greatly.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—Ed.

Salary for Services.

SIR.—Would a builder be justified in charging up a weekly salary when acting as architect, surveyor and builder in the development of a small housing estate? He is receiving a fixed percentage of profit on costs, in this case 12½ per cent. Should this percentage include anything other than net cost of labour and materials? One member of the firm's time would be solely devoted to the work in question. W. E. B.

Contracts.

[REPLY TO "QUERY," DECEMBER 11.]

SIR.—An invitation to tender is an offer to negotiate—an offer to receive offers—an attempt to ascertain whether an offer can be obtained within a certain margin of cost. If the tender, or offer, has in it the essential elements of a legal contract, and the acceptance of it is absolute and identical with the tender, or offer, and is communicated to the offerer within the prescribed time, or, where no time is fixed, in a reasonable time, then the tender or offer is binding and there is a legal contract set up. In *Croshaw v. Pritchard & Renwick* (1899), 16 T.L.R. 45, an "Estimat" was accepted; subsequently the builders wrote that they had made an error in their figures and must withdraw their "Estimat." It was held that the "Estimat" was a binding offer and being accepted by the employer became a legal contract. Therefore the contention by "Query" is correct. (See chapter II, Creswell on "Building Contracts.") CONTRACT.

Four-flatted Blocks.

SIR.—Could you advise me as to whether it is possible for me to commence in business as a builder? I am a bricklayer by trade and have £250. I propose to build two-story four-flatted blocks to rent, each flat at 12s. Do you consider this to be a paying proposition? Each flat would be self-contained with living room, two bedrooms, and the usual offices. What is the approximate cost of erecting a block? The fittings are the usual council house type. Which subsidy would you advise me to work under if a subsidy is payable? W. D.

Contract Documents.

[REPLY TO "T. L. W.," DECEMBER 4.]

SIR.—The usual procedure under any contract is to visit the architect's offices after having received the bills of quantities and conditions of contract. You then take particulars by tracing plans, if the architects do not supply separate copies; visit site; price quantities or estimate lump sum; attend the opening of tenders or await result by letter from architect. This covers all the contract documents until tender is accepted, when, no doubt, the contractor will enter into bond and sign the R.I.B.A. form. G. W. H.

Fixing Gutter.

[REPLIES TO "REGULAR READER," DECEMBER 11.]

SIR.—Querist does not say what his instructions were. It is no. usual and certainly not safe to put a duck-board on to any gutter, unless the duck-board is fixed at the ridge. Furthermore, the screws, however fixed, have to face weather conditions—swollen wood in wet weather and dry weather shrinkage. Why not bolt the ironwork supporting the gutter into the rafters? Any calculation would be a risk; one is not sure if every blocking is so well nailed as it appears to be. G. W. H.

SIR.—Unless querist is dealing with some very fusty theorist of an official, let him stick to his guns. The method he shows is perfectly sound until the fascia is rotted, and the alter-

native method is perfectly sound until the plate is rotted, and as the amount of timber to rot is much the same in each case there is nothing in it, beyond the fact that the rotting of the fascia will be apparent long before that of the plate, which is in his favour.

JOHN BULL.

Measuring Stonework.

[REPLY TO "Q. S.," DECEMBER 11.]

SIR.—It is very difficult to say whether the method of measurement quoted would be universally taken to follow the standard method. In tendering it would be well to qualify the total with an explanation of the method adopted in this case, in order to protect against misunderstandings.

ABSTRACT.

Making of Special Bricks.

[REPLY TO "BRICKS," DECEMBER 11.]

SIR.—In a simple box mould shaped to the cant or bullnose, as required, the raw pressed brick can be cut with a knife to the required shape before burning. One labourer can turn out about 2,500 of such specials in a day with ease at a cost of about 10s. or 11s., and an extra of 5s. per thousand for specials is likely to be obtained and so show a good profit.

Z.

Hard Tennis Court.

[REPLY TO MR. W. DRAKE, DECEMBER 4.]

SIR.—A tennis court laid with a coarse gritted grano surface on a suitable concrete bed, is likely to be neither cheap or satisfactory. Wear on shoe leather would be enormous, jar to the tread severe, and bounce of ball far too quick for even the fast game of to-day. A very good cheap surface may be obtained by levelling the ground, laying and rolling thereon a bed of clinkers about 6 in. to 4 in. thick, and rolling thereon fine binding ashes. The best type I have met with are those obtainable from a brick kiln, which are composed of well-burnt coal dust and burnt clay dust mixed, and this sets to a very true, fine surface.

DEUCE.

Plans of Adel Church, near Leeds.

SIR.—An American architect requires plans and particulars of Adel Church, near Leeds, and I am informed that such exist. If any reader could give me information I should be obliged.

W. A. D.

Damp-proofing Walls.

[REPLIES TO "INQUIRER," DECEMBER 18.]

SIR.—Thoroughly rake out the joints of brickwork and rough hack all over to form a key. Then apply two coats of Portland cement and sand mixed 2 and 1, with the proper quantity of waterproofer. If querist will look on page lxxxv of your last issue under the heading "Waterproofing Cement," he will find a dozen firms who would tell him the quantity to be used.

G. W. H.

SIR.—There are many reliable solutions on the market for waterproofing brickwork, but in nearly every case the damp wall must be first dried out, and that presents some difficulty. A good and inexpensive method of dealing with a damp wall is to treat the outer surface with several coats of Portland cement wash. The more damp the wall is the better will the cement wash adhere. The work should be carried out in cold, damp weather, but avoiding frost.

JOHN H. HARE.

Building Line.

[REPLY TO "ENROBSO," DECEMBER 18.]

SIR.—By Section 3 of the Public Health (Buildings in Streets) Act, 1888, it is not lawful in any urban district without the written consent of the urban authority, to erect or bring forward any house or building in any street,

or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street. If a rural district council desires to have the powers under this Act, application to the Ministry of Health is necessary, for an order under Section 276 of the Public Health Act, 1875. "Enrobsa" should enquire whether the rural authority concerned has in fact acquired the powers of the Act of 1888. If it has, then he will come within the Act and should obtain the consent of the local authority to his plans before attempting to bring the building forward. C.

THE A.A. PLAY

IN the R.I.B.A. Galleries, on Wednesday, Thursday, and Friday of last week, students of the Architectural Association gave their annual theatrical performance with customary success. This year it took the form of a *revue* in eleven scenes, entitled "The Touchstone, or Architectural Explorations," and started well with the "President" and "Secretary" of the R.I.B.A. endeavouring to find an answer to the question: "What is Architecture?" They fail, and appoint a commission of enquiry, whose efforts to solve the riddle were shown in succeeding scenes. Now and again the quest was entirely forgotten, but nobody minded, for what was lost in thematic continuity was more than compensated for by the humour of the unrelated numbers and the high spirits of the performers. The last scene but one showed the "President" and the "Secretary" of the Institute reduced to despair at the failure of the commission to discover what architecture is. After an unsuccessful attempt at suicide they receive a message to say that the answer is to be found in Bedford-square, where they immediately adjourn, and plunge ecstatically into the revels which happen to be proceeding.

Apparently some old-fashioned members of the profession have criticised the spirit of gaiety which is alleged to prevail in the architectural schools, for in one clever sketch entitled "Three Characters," we found an architect father reproving his would-be architect son for taking part in the A.A. Play, and not devoting himself with sufficient seriousness to the study of his chosen profession. The father says, angrily, that he never did such things in his young days, and the son retorts: "Of course not; look at Regent-street!" If cause and effect are related in the way implied, then the present enthusiasm for amateur theatricals ought to ensure a great improvement in the architecture of the future.

The *revue* was full of good things, but special mention should be made of an ingenious sketch entitled "Decoration *a la Carte*," in which a West End "decorative specialist" proposes to remodel an Adam house on "period" lines for an ill-informed masculine client, and to resell the original decorations to a lady client at a greatly enhanced price. The lady happens to discover the intended swindle, and punishes the "decorative specialist" by going off with his assistant. Another good thing was a clever representation of a cinema film entitled "The Leaven of Love," complete with "captions" in the best Hollywood manner, showing how a young man "found through architecture a way to love."

Lack of space prohibits a full description of the *revue*, which was uniformly excellent. The "book" prepared by a number of skilful hands, was pointed and witty, while the musical side included several tuneful numbers specially written for the occasion. Good work was done by the whole cast, which included Mesdames Prudence Bateson, Anne Brinton, Joy Wall, Agnes Blades, Marion Pepler, Francis Buckland, Marjorie Spencer, Kathleen Winter, Janet Fletcher, and Messrs. R. Walker, I. B. Jeffcott, J. D. Beloe, E. G. S. Elliott, H. S. M. Carver, R. S. Lavers, S. N. Bertram, L. H. Roberts, D. D. Robinson, E. G. Gardner, R. F. McQuistan, J. Waddington. A small orchestra performed well under the conductorship of Dr. Oscar Faber. The scenery, too, painted by A.A. men, was excellent.

THE BUILDING TRADE

TENANTS' LIABILITY IN RESPECT OF MAKING-UP STREETS

THE recent case *Lowther v. Clifford* (*Weekly Notes*, November 14, 1925) again draws attention to a point which was the cause of much litigation several years ago—the liability of tenants under certain terms in their leases to bear the expenses of making up new streets.

By lease dated May 14, 1885, the plaintiff's predecessors in title had demised certain land to the defendant for seven years at a rent of £46. This land fronted what was then known as Ferry-lane, at Barnes. The lease contained a covenant by the defendant to pay during the said term all "assessments impositions and outgoings" now payable or thereafter to become payable by either the landlord or the tenant in respect of the premises. At the end of the demised term the defendant continued to hold over, and had remained as a tenant from year to year.

In the year 1924 the plaintiff under the Private Street Works Act, 1892, had been served with a notice to pay £188 in respect of expenses incurred by the Urban District Council in doing certain work on that lane under the above Act. No particulars are given in the report as to this, but presumably the usual procedure had been followed calling upon the owners to make up the road, at this date called in the report "Ferry-road." The plaintiffs, the landlords, had paid this sum but were seeking to recover it from the defendant under the above covenant in the lease.

The Court held that the words "impositions and outgoings" in the lease covered the payment in this case, and the fact that the tenant was holding over as tenant from year to year did not affect his liability, as he was holding over on the terms of the lease.

The importance of the decision lies in the fact that the plaintiff cited the cases of *Batchellor v. Bigger* (1889, 60 L.T. 416); *Foulger v. Arding* (1902, 1 K.B. 700; *The Builder*, March 22, 1902); *in re Warriner* (1903, Ch. 367); and *Stockdale v. Ascherberg* (1904, 1 K.B. 447; *The Builder*, June 27, 1903).

In the first of the above cases the expression "outgoings" was held to include the owner's proportion of paving a street under the Metropolitan Management Acts. In *Foulger v. Arding* the word "impositions" was held to include a structural defect which rendered the premises insanitary which the owner had been called upon to remedy under Section 4 of the Public Health (London) Act, 1891. In *Stockdale v. Ascherberg* the word "outgoings" was held to embrace complying with a notice under the Public Health Act to abate a nuisance which required relaying a drain. In *in re Warriner* the word "imposition" was applied to reconstructing a drain to comply with an order made under the Public Health (London) Act, 1891.

In these two latter cases the tenants upon whom the burden was held to fall were holding the premises under agreements for three years, but in *Foulger v. Arding* the term was 16 years.

We may add to these cases a case not mentioned in this report, *Greaves v. Whitmarsh, Watson & Co.* (1906, 2 K.B. 340; *The Builder*, July 7, 1906), where the word "outgoings" rendered the lessee liable to pay the expenses of making up a road incurred under section 150 of the Public Health Act, 1875, and there can be no question that expenses incurred under the Private Street Works Act, 1892, are upon the same footing.

The defendant cited *Valpy v. St. Leonards Wharf Company* (1903, 67 J.P. Ch. 402) and *Harris v. Hickman* (1904, 1 K.B. 13; *The Builder*, November 21, 1903), two cases heard by Judges of first instance in which it was held in a lease from year to year (*Valpy's case*) or where a tenant was holding over from year to year (*Harris's case*), it ought not to be imputed

that the tenant intended to make himself liable for an expenditure exceeding his rent.

The learned Judge in the case we are noticing considered that these two last decisions were inconsistent with the cases cited by the plaintiff; *Foulger v. Arding* and *Stockdale v. Ascherberg* being decisions of the Court of Appeal.

We may also notice that this view had already been adopted by some text-book writers, but now the case we are considering will afford a definite authority. It certainly does appear hard, to say the least of it, that a tenant at a small yearly rent should find himself saddled with a liability possibly far exceeding his annual rent, but it must be remembered that this is not the fault of the law, but the result of the terms of an agreement into which he has voluntarily entered.

For some 25 years at least from some of the decisions we have cited above it has been known that the use of certain words in leases will have the effect of imposing burdens of this kind on tenants if they accept leases in that form, and it is now too late for them to expect the law to deliver them from their own acts. In short leases it is certainly inequitable that the burdens we have indicated above should be removed from the shoulders of the landlord and be imposed on those of the tenant; but a stand should be made by tenants or their legal advisers against executing documents which will have this obvious result. The liabilities can be dealt with equitably between the parties in any lease, but a common form is too often accepted without due consideration of its effect. In sanitary questions the landlords may prove recalcitrant as an insanitary condition may well be contributed to or even caused by neglect on the part of the tenant, and the extent of the operation required can neither be foreseen nor defined; but in the case of a man who rents houses or land on what is obviously a private road the case is otherwise. It must be apparent that at some date the local authorities may require that road to be made up, and few landlords granting a short lease would fail to see that such a liability could not fairly be imposed by the agreement upon the tenant. We have often dealt with this question before and urged upon tenants the necessity of looking before they leap.

THE RATING BILL

THE Minister of Health through his Private Secretary has issued a reply to various petitions that have been lodged against the proposals contained in the Rating and Valuation Bill. This has proved a highly contentious measure not merely in the "party" sense, as it has aroused opposition throughout the country from persons of various political opinions, and apart from "party" (the Government having pledged itself to carry it through and therefore having the support of loyal members), it is difficult to say whether it has the real support of the majority of the electors. Whilst never expressing an opinion on the merits of the measure as a whole, we have always doubted whether a contentious measure such as this was one which the Government need have put forward in its first year of office when matters of graver importance appeared to call for prompt attention.

The reply of the Minister (which appeared in *The Times* on November 7) can be compared with the paper read by Mr. P. Michael Faraday at the Auctioneers' and Estate Agents' Institute two days previously, and it will be seen the reply does not, as published, cover all the points raised by Mr. Faraday. The reply of the Minister, as reported, seems addressed to the following points:—That the Bill will reduce the rating authorities from 12,892 to 688 and thus simplify bookkeeping, &c., and reduce expense, and that the Bill will not create an army of new and highly-paid officials. That the statement that the Bill would transfer the preparation of valua-

tion lists from an impartial body to a spending body is also ill-founded.

The suggestion that the district council might manipulate the assessments so as to make the poundage appear low is met in the reply by two statements: (1) The ratepayers would consider the amount they had to pay and they were not likely to be persuaded that a low rate on a high assessment was more favourable to them than a high rate on a low assessment. We do not follow this statement. To the bulk of the ratepayers the word "persuasion" is unknown in this connection, and a "demand" in the form of a "note," is all they are conscious of experiencing. There may, however, be more in the second reason given, which was, that the precepts of the county councils would be in the form of a uniform rate in the pound and any district council which was foolish enough to make its assessment artificially high would be merely taxing itself for the benefit of its wiser neighbours. The objection that the Bill deprived the parish of its present participation in the basis of local taxation through the preparation of the valuation list by the overseer was met in the reply by referring to the undertaking given by the Minister to introduce an amendment whereby parish councils could appoint a person to act as an additional member of the valuation committee in respect to the valuation of properties in the parish. The reply further pointed out that the Bill made the assessment committee representative of the various classes of local authorities.

Turning to Mr. Faraday's paper we find the first point he made was that it was becoming evident that the main object of the Bill was the transfer of the duties of assessment from the present assessment committees to committees of the county councils in order to abolish the guardians and he argued that centralisation of management always had the effect of increasing expense, and he instanced the transfer of education from the School Boards to the Education Authority, and also referred to the Metropolitan Water Board.

He also argued that the county councils and borough councils already are sufficiently burdened with what they have to do and the increased burden could not make for efficiency. He also referred to the undesirability of appeals under the Bill to the assessment committees as constituted under the Bill representing the direct spending authorities as unsatisfactory—meaning, we presume, by "appeals" "objections" under the Bill—and he referred to the temptation to increase rateable value to decrease apparent poundage. He also considered that the Bill would tend to abolish equality of rating as between class and class and property and property.

This is only a brief summary of some of the points contained in both the above documents, but we may conclude by quoting from Mr. Faraday's paper a passage in which he outlined what legislation he considered was required: "A short measure compelling periodical valuations within time limits, the consolidation of rates, the synchronisation of county valuation lists with local valuation lists, and the abolition of gross value altogether."

Obituary.

The death has occurred of Sir Ernest Edward Pearson, of Brickendonbury, Hertford, director of the firm of contractors, S. Pearson & Co., Ltd.

Mr. W. Holt, builder and contractor, of Midland-road, Swinton, near Rotherham, died recently at the age of 76.

The death has occurred of Mr. Walter Dunk, aged 72 years, a retired builder and contractor, of Barnsley.

At the age of 85 the death has taken place of Mr. Charles Geen, J.P., builder, of Okehampton.

A CONGRESS OF THE BUILDING INDUSTRY

In the paper which he read at the R.I.B.A. last week, on "The Condition of the Building Industry," Mr. Herbert A. Welch, F.R.I.B.A., quoted a letter by Mr. Robert D. Kohn, Chairman of the Committee on Industrial Relations, American Institute of Architects, which appeared in the *Architectural Association Journal* under date June 19, 1925, showing what has been accomplished by the "Congress of the Building Industry" in the United States. In view of the importance of this matter to all who are in any way concerned in the building industry we quote the substance of the letter hereunder:—

"We are glad to acknowledge our indebtedness to Mr. Malcolm Sparks" (writes Mr. Kohn), "for the plan of co-operation between the various elements of the building industry upon which we have embarked in the United States was primarily inspired by his efforts to organise the Parliament of the Building Industry in England during the war. As far as I can discover, his war-time effort has left no permanent organisation of similar character in England. It inspired a movement, however, in this country which is carrying on with great success.

"I refer by this to the 'Congress of the Building Industry' which was started in 1920 in a preliminary way in this country, and which in the last three years has developed into a group of local organisations in half a dozen of our more populous communities; New York, Boston, Philadelphia, Portland (Oregon), Seattle and the State of New Jersey. Each of these organisations includes within its membership what we call the technique of the industry (the architects and the engineers), the labour of all the crafts of the industry, the builders (here called general contractors), the sub-contractors, the building material distributors, and finally, the representatives of finance principally interested in building loans.

"We are therefore gradually developing here through these local organisations a medium of co-operation between the various elements that jointly render a certain service to the public, and this co-operation enables each different function within the building process better to understand all the other functions within the process. Already each of these local groups has developed a system of apprenticeship training in the building crafts. This enlistment into and training for the industry is one of our most important problems as it is with you. Time and again in different places efforts have been made to start systems of apprenticeship training through either the joint efforts of the labour organisations and employers or by these two groups with the co-operation of the local education boards. Frequently these efforts have failed. Since the Congress of the Building Industry has been formed renewed efforts in this direction have been undertaken under the guidance of the architects and with the co-operation of the other elements previously mentioned as being part of these groups (and with the local education boards).

"Just as an illustration of the results attained in three brief years of work I may cite that in New York City alone the number of apprentices being trained in various crafts has increased from a few hundred to two or three thousand. Here, too, there are restrictions by unions upon the number of apprentices to be introduced into any craft, but the neutral investigations conducted by our 'Congress' groups have shown that, as with you, there were in no trade as many apprentices being trained by the employers as were permitted by the union rules. Nor have we yet, even with our large increase above recorded, reached the maximum permitted by the unions. Time enough to discuss these rules when this limit has been reached. Indeed, it is only fair to say that we frequently find a more ready response from labour in the matter of starting apprenticeship training than we get from the employers.

"Apprenticeship training is only one of the many educational efforts undertaken by the Congress groups, educational in the sense that they educate the participants in the efforts rather

more than those ostensibly to be benefited. Seasonal unemployment; unfair practices on the part of builders or of labour; inadequate performance on the part of the architects; industry codes of ethics; surveys of likely shortages of materials or labour, are all topics that engage various Congress committees in the different cities.

"It must not be supposed that what we have done here has been all plain sailing or that we have solved the problem of industrial relations in the building industry in the United States. We have hardly scratched the surface of the problem. But we are certain we have started in the right direction. The fundamental principle announced in the declaration of purpose of each of these Congress groups is that the object to be attained is the study of the functioning of the building industry through the joint effort of all of the elements that are necessary to the industry so that the mistakes and the difficulties may be done away with that lie in the way of an adequate service of the industry to the public.

"The results of our three or four years' effort have already proven that this scheme of building industry organisation in which the architects have taken a hand has produced what we may call a by-product even more important than apprenticeship training, the doing away with seasonal unemployment and the correction of unfair practices within the building industry. This more important thing which has been accomplished, and which is recognised by hundreds of architect members of those Congress groups, is that the work done jointly on these various committees by architects, engineers, labour men, building trades employers and others interested in building work has established between the individuals thus working together an understanding of and a sympathy with each other's problems, of the functioning of the industry as a whole and of the relation of any one part to the whole, which unquestionably will result in a willingness to be more reasonable when those difficulties arise. This realisation of a common purpose is in itself the most important thing that we think we have accomplished. It is the recognition of the fact that the architect needs this kind of education as much as anyone else that has caused the American Institute of Architects to instruct the committee of which I happen to be chairman to encourage its members to invite the co-operation of others in the building industry to help in the formation of 'Congress' groups, such as I have described, in every part of the country."

Institution of Public Lighting Engineers.

At a Council Meeting of this Institution, held at Leeds at the termination of the second Annual Meeting and Conference, Mr. S. B. H. Langlands, J.P., the retiring President, was thanked for the able manner in which he had carried out the duties of President during his year of office, and for his valuable services at the inauguration of the Institution. The Council also expressed their thanks to Mr. W. J. Liberty (Hon. Secretary) for services rendered, and presented him with a cheque.

Mr. Leon Gaster, Hon. Secretary of the Illuminating Engineering Society (England), was admitted an Hon. Member of the Institution.

It was confirmed that the third Annual Meeting and Conference be held in September, 1926, in Newcastle-upon-Tyne, under the presidency of Mr. R. Davison, Superintendent of the Public Lighting of that city.

Widening Bishopsgate.

The L.C.C. has agreed to contribute one-half of the cost to widening Bishopsgate to 60 ft. in front of No. 87 to St. Botolph's Church on the west side, and Nos. 106 to 126 on the east side, at an estimated cost of £141,113.

NEW COMPANIES

The particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 and 118, 'Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

PAPER-STUCCO DECORATIONS, LTD. (209,593). Registered November 10. 52, Rathbone-place, Oxford-street, W.1. House decorators, sanitary engineers, &c. Nominal capital, £1,500.

BARGMAN & SON, LTD. (209,475). Registered November 2. Bank Chambers, 80A, High-street, Dorking. Builders, contractors, &c. Nominal capital, £4,000.

SILVERTOWN TARMACADAM CO., LTD. (209,470). Registered November 5. Salisbury House, London Wall, E.C.2. Dealers in slag, stone or other materials, &c. Nominal capital, £10,000.

LIGHTWOOD BRICK & TILE CO., LTD. (209,662). Registered November 13. Brick and tile manufacturers. Nominal capital, £20,000.

GILBERT & HALL, LTD. (209,640). Registered November 12. General builders and contractors, &c. Nominal capital, £12,000.

R. B. GIBSON, LTD. (209,648). Registered November 12. Painters, decorators, &c. Nominal capital, £5,000.

CONSTRUCTORS UNION, LTD. (209,655). Registered November 13. Builders and contractors, &c. Nominal capital, £5,000.

LANGLEY LONDON, LTD. (209,694). Registered November 14. Dealers in bricks, tiles building materials, &c. Nominal capital, £25,000.

MIDDLETON & CO. (BLACKPOOL), LTD. (209,738). Registered November 17. Contractor and builder. Nominal capital, £5,000.

IDRIS TILE & SLABBING CO., LTD. (209,628). Registered November 12. 20A, Wilderspool Causeway, Warrington. Manufacturers and merchants of slabbing tiles, &c. Nominal capital, £200.

NOVOCRETE & CEMENT PRODUCTS CO. (NORTHERN AREA), LTD. (209,200). Registered October 2. 3, Regent-street, S.W.1. To enter into an agreement with Novocrete and Cement Products Co., Ltd. Nominal capital, £20,000.

STEYNING LIME & BRICK CO., LTD. (209,619). Registered November 11. Lime and cement manufacturers. Nominal capital, £10,000.

REINFORCEMENTS, LTD. (209,487). Registered November 5. Westminster Chambers, 28, East-parade, Leeds. Reinforced concrete or structural steel engineers, &c. Nominal capital, £1,000.

ENGINE FOUNDATION & CONCRETE CONTRACTORS, LTD. (209,242). Registered October 26. 27, Soho-square, W.C. Builders in concrete, brickwork, &c. Nominal capital, £5,500.

WILLIAM JAY (WESTCLIFF), LTD. (209,265). Registered October 26. 107A, Hamlet Court-road, Southend-on-Sea. Builder and contractor. Nominal capital, £2,500.

T. H. PALMER, LTD. (209,847). Registered November 21. Quarry masters and stone merchants. Nominal capital, £2,000.

COLLARD & SON, LTD. (209,877). Registered November 23. Monks-road, Exeter. Stone and marble masons, &c. Nominal capital, £500.

BIGGIN & CO., LTD. (209,864). Registered November 23. Slaters, tilers, plasterers and builders. Nominal capital, £6,000.

J. A. WHITEHEAD, LTD. (209,858). Registered November 21. Builder and contractor. Nominal capital, £100.

EVANS, JONES & EVANS, LTD. (209,805). Registered November 20. Builders and contractors. Nominal capital, £500.

J. W. MOORE & SON (ILFORD), LTD. (209,812). Registered November 20. 34, Water-lane, Ilford, Essex. Builder and decorator. Nominal capital, £2,000.

THOMAS CLEMENTS & SONS, LTD. (209,794). Registered November 19. Dene Joinery Works, Selborne-gardens, Newcastle-upon-Tyne. Builder and contractor. Nominal capital, £2,500.

LANCASHIRE CONSTRUCTION CO., LTD. (209,886). Registered November 23. Field-street Saw Mills, Field-street, off Henry-street, Blackpool. Builders, contractors, &c. Nominal capital, £7,000.

DRAIN REPAIR DISPUTE

In the Mayor's and City of London Court, on December 4, before the Recorder, Sir Ernest Wild, K.C., a claim was made by Messrs. Sinfield & Harmer, builders, decorators and sanitary engineers, Camomile-street, E.C., against Messrs. Berrick Bros., Ltd., of Camomile-street, E.C., for £111 3s. 6d., balance of account for work done in relaying drains at the defendants' premises in the early part of this year. Mr. Morgan, counsel for the plaintiffs, outlining the case, said that the work, which was of a difficult nature, had occupied plaintiffs for 10½ weeks. It was found that the drains in the defendant's premises had got into a very bad condition, necessitating work inside the premises, and in the roadway, the latter being done by the Corporation. Accounts had been rendered as the work proceeded, and defendants had paid a total sum of £260 on account, leaving the balance sued for due. Apparently they disputed the length of time taken by the plaintiffs, the amount of material supplied by them, and the number of men employed, as well as the commission charged in respect of profit. The first witness called by Mr. Morgan was Mr. Ralph, sanitary inspector of the City Corporation, who superintended the work done by the plaintiffs. He said that the work was of an unusual character as the drains beneath the asphalt floor of the defendants' premises had been leaking, and the ground in the vicinity had become saturated. Asked whether 10½ weeks was necessary to do the job, the witness expressed the view that instead of the six men employed by the plaintiffs, four men working for seven weeks should have

been sufficient. With regard to the plumbing, he thought three days would have been sufficient time in which to do everything necessary. Cross-examined, witness said he understood that one of the items disputed by the defendants was the charge for 404 hours made for the time spent on the job by Mr. Harmer, a partner in the plaintiffs' firm.

Mr. A. T. Harmer denied that he employed more men than necessary, or for a longer time than was required. He himself superintended the job for 10½ weeks. Of the 404 hours which he had charged as representing his services, he spent a quarter of that time in plumbing. That meant he was plumbing for eight hours a day for two and a-half weeks on the rain-water pipes, and in the dismantling of and re-fixing lavatories and lavatory basins. Questioned about the material supplied, witness said that in reference to four drainpipes, 200 bricks, and 10 bags of cement, no bills had been produced, because they were taken out of his firm's stock. The charge in the bill for 10 per cent. for cutting and breakages was a customary one in the trade.

His charge of 33 1-3 per cent. on the cost of labour and materials was also customary.

Mr. Frederick Allen, of the firm of Gray & Allen, gave evidence to the effect that 33 1-3 per cent. on material and time was the customary trade charge. The size of the job would be taken into consideration.

Mr. W. S. Crosher, chartered surveyor, gave evidence on behalf of the defendants. He said he had inspected the work after completion, and, in company with Mr. Ralph, had found that the

Garden Statue of Pan in Cast Concrete.

Model for a Bronze Door Knocker.

charges made by the plaintiffs worked out at £4 10s. per foot for the drains. His view was that the work, even assuming it was more than usually difficult, should have been done for 30s. per foot. He thought that one man superintending, and two labourers could have done the job in seven weeks. His experience was that the charge for profit should be 15 per cent., or in exceptional cases 20 per cent.

The Recorder said that, taking everything into account, he came to the conclusion that for the time and labour, charged by the plaintiffs at £194 17s. 8d., he would allow £100. As to the four drain pipes, 200 bricks, and 10 bags of cement, he disallowed that, remarking that it was intolerable that no accounts should be kept of such transactions which would enable the customer to check the charge. The charge for cutting and breakages he thought was a fair one. As to the percentage of profit, he came to the conclusion that the proper profit chargeable would be 25 per cent. The net result was that the plaintiffs were entitled to receive upon the whole bill £222 15s., and as the defendants had paid £260, they would have judgment on the claim, with costs, and judgment on the counterclaim for £37 5s.

CAST-CONCRETE STATUARY

The illustrations which appear on this page show two rather amusing examples of modern grotesquerie. The garden statue of Pan is interesting not only for the deft handling of a quaint subject, but for the fact that the figure, which is life-size, is cast in white concrete. The delicacy of the casting proper and the smooth surface texture which has been obtained reveal rather strikingly the possibilities of white cast-concrete in relation to figure sculpture. The smaller illustration is of a model for a bronze door-knocker. Both examples were designed and modelled by Messrs. Gilbert Seale & Son.

THE L.C.C. HOUSING ESTATES

LAST week Colonel C. B. Levita, Chairman of the Housing Committee, of the L.C.C., conducted a Press tour of the various housing estates under his supervision. The main divisions of the work are: (1) the improvement or reconstruction of unhealthy areas, including the provision of dwellings for rehousing persons of the working classes displaced, and (2) the provision of new dwellings to meet the need for additional accommodation.

Up to the end of 1914 the Council and its predecessor, the Metropolitan Board of Works, had carried out 35 schemes for the clearance of some 97 acres of slum property, with a consequent displacement of 45,699 persons. In addition, the execution of the scheme for the clearance of the Tabard-street, Grotto-place and Crosby-row areas (17 acres), involving the displacement of 4,552 persons, had been commenced when the war broke out. The Council itself undertook the rehousing operations in connection with slum clearance schemes, and also provided a large number of dwellings in lieu of accommodation destroyed in connection with public improvements. In addition the Council subsequent to 1900 supplemented these compulsory rehousing operations by the voluntary provision of additional housing accommodation in block dwellings in the central districts and cottages in suburban districts. Altogether up to March 31, 1919, accommodation had thus been provided for 58,873 persons in 6,543 tenements and 3,442 cottages, besides three lodging houses containing 1,880 cubicles. Since the war the Council has completed over 11,100 houses and flats, with accommodation for about 84,000 persons. Altogether, therefore, accommodation for nearly 143,000 persons, calculated on the basis of two persons a room, has been provided by the Council up to the present time in 21,042 tenements and cottages and three lodging houses with 1,880 cubicles. There are also at various estates 141 shops, 101 workshops, 284 sheds, &c., and 1,304 allotments. Up to March 31, 1925, the capital expenditure on all dwellings and estates, including clearance of unhealthy areas, amounted to nearly £17,100,000. Since that date over £1,500,000 has been spent in addition. The rent roll from the dwellings at the present time exceeds £800,000. Since the war the Council has undertaken the clearance of 19 separate areas; the cost of these schemes, including acquisition of property, clearance and roadwork, but not including the cost of providing accommodation for rehousing the persons displaced, is estimated at £1,145,200.

The first area to be visited was the Brady-street district, whose tumble-down dwellings and narrow courts constituted one of the worst and most notorious slums in London. Six blocks of tenements are being erected on this site of 7½ acres, and 1,875 persons are to be comfortably housed. In most cases a space is retained in between the houses for a park or recreation ground, and is laid out to include trees. The transformation from the really indescribable squalor of the slums to the big blocks of airy and pleasant tenements is an appreciable and praiseworthy step towards a better London. The rents, inclusive of rates and water charges, are from 11s. 11d. to 12s. 6d. for two-room tenements; from 14s. 9d. to 16s. 3d. for three-room tenements; from 18s. 5d. to 20s. 5d. for four-room tenements; and 21s. 1d. for five-room tenements. These are certainly a little higher than those of the dispossessed dwellings, and this partially accounts for the reluctance of the tenants to leave. Our representative was informed by Colonel Levita, however, that these people were not poor and could afford the difference.

The largest of the Council's estates is at Becontree, and covers an area of 2,700 acres. The original plan for the development of the estate provides for the erection of upwards of 20,000 houses, of which about 550 are occupied at the present time. Provision has been made for a central park, recreation grounds and open spaces, allotments, churches, schools, shops and other public buildings, the more important of which will be grouped in the centre. A con-

siderable area of land has been reserved for business premises and municipal requirements. Provision has also been made for a green belt round the estate on its London side. The development of the estate, which was commenced in 1920, is being carried out under a cost contract with Messrs. C. J. Wills & Sons, Ltd. Many of the buildings are of the usual brick construction, but concrete construction has also been adopted. The rents, inclusive of rates and water charges, range from 10s. 1d. to 14s. 2d. for the flats, and from 12s. 8d. to 22s. 7d. for the houses of three, four and five rooms. The rents of the six-roomed houses vary from 23s. 10d. to 26s.

The White Hart-lane estate, of 177 acres, is situated between Lordship-lane and White Hart-lane, Tottenham, 1 mile from Wood Green Station and ½ mile from Bruce Grove Station, both on the London North Eastern Railway. Before the war 40 acres were developed by the erection of 963 houses. Three acres have been laid out as an estate garden. Under the State-assisted scheme of 1919 about 720 houses have been erected apart from 72 flats in three-story dwellings provided as rehousing accommodation under the Ware-street clearance scheme. Seven acres have been allocated to allotments, and nearly 4 acres to open spaces. An arterial road, 100 ft. wide, known as the New Cambridge-road, traverses the estate. The Lordship-lane frontage is being developed by the erection of three-story buildings comprising 138 dwellings and two shops, the ground floors being constructed as flats capable of conversion into shops should occasion require. A further section is now about to be developed by the erection of about 350 dwellings.

The Council in 1920 made a scheme for the clearance of the Ware-street area of 9½ acres. The clearance of the area is now proceeding, and it is estimated that 2,648 persons will be displaced, of whom 2,160 are to be rehoused on the area. The first block of dwellings to be erected on the estate provides accommodation for 228 persons. The estate will ultimately comprise nine blocks of dwellings.

As part of the rehousing accommodation to be provided under the scheme 72 flats in three-story dwellings to accommodate 378 persons have been provided on the White Hart-lane estate, Tottenham. Again the same open airy appearance characterised the tenements, and is now appreciated by the tenants. Each front door opens on to a long, railed, concrete platform, which thus takes the place of the ordinary street. In some cases a lift conveys people to and from the ground and their particular floor.

The party next visited the Tabard estate, Southwark, comprising some 13½ acres, and standing upon the site of the old Tabard-street area condemned before the war as an unhealthy area, immoral and verminous. Accommodation for about 2,400 persons has been provided in seven blocks of tenement dwellings grouped round an area of about 5 acres which, when cleared, will be laid out as a public open space. The old courts and alleys have been swept away, new 40 ft. roads have been constructed, and Tabard-street itself is being widened to 40 ft. The gross weekly rents, inclusive of rates, are from 9s. 11d. to 15s. 6d. for a tenement of two rooms; 13s. 5d. to 18. 9d. for three rooms; 15s. 7d. to 21s. 4d. for four rooms; and 21s. 11d. to 23s. 10d. for five rooms.

The Downham estate, near Lewisham, was next visited. Of this 516½ acres, 133 acres have been reserved for open spaces, &c., 34½ acres for the erection of shops, schools, churches, &c., and the remaining 349 acres will be devoted to dwellings. The first section, that portion contiguous to the main Bromley-road, is now in course of development, and will consist of about 2,170 houses and flats.

The Bellingham estate of 176 acres comprises 2,089 dwellings, consisting of 132 two-roomed flats, 156 three-roomed flats, 411 houses of three rooms, 986 of four rooms, and 404 of five rooms. The density of houses over the whole

estate is about 12 to the acre. There are about 10,000 persons resident on the estate, and provision is made for allotments, schools, places of worship and shops. This estate has been in existence for two years and, in addition to proving entirely satisfactory in use, presents an extremely attractive and pleasant appearance.

The final visit was to the East Hill estate, Wandsworth, which has been provided by the Council for the purpose of rehousing persons displaced by the clearance of unhealthy areas in London. It is proposed to provide accommodation for 3,280 persons in 537 tenements, comprised in five-story buildings. Each tenement will be self-contained and will comprise, in addition to the living, etc., rooms, a kitchenette (in which a bath will be placed) and other domestic offices. It is proposed to erect a few shops on the East Hill frontage of the estate, and to preserve a pleasant open green square in the main front.

NEW BUILDINGS IN LONDON.

Bermondsey.—Messrs. J. Moir Kennard & Son, architects, 13, Railway-approach, London Bridge, S.E. 1, have prepared plans for a two-story building in Rothsay-yard, Rothsay-street, S.E., for Mr. H. Lee, 242, Bermondsey-street, S.E.

Braintree.—Plans have been prepared by Mr. E. O. Wheeler, 71, Rayne-road, Braintree, for the erection of twelve houses at Bocking.

Chorley Wood.—A group of twenty houses is to be erected in Chapel Hamlet by Mr. W. E. Ellis, Croxley Green, Watford, at a cost of £10,000. Mr. C. W. Richardson, architect.

Carshalton.—Plans have been prepared by Mr. Andrew Mather, F.R.I.B.A., architect, 38, John-street, Bedford-row, W.C. 1, for a new church.

(For rates of wages in the Building Trade in Scotland, see page 917.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, etc.

DECEMBER 27. — **Folkstone.**—PAVILION.—Erection of a cricket pavilion at the Sports Ground, Cheriton-road, for the Corporation. A. E. Nichols, M.Inst.C.E., Borough Engineer, 11, Church-street, Folkstone. Deposit £5 5s.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

BARNSELY.—In connection with the proposed alterations at the Corn Exchange, the Markets Committee now recommend the provision of shops and offices.

BATH.—The T.C. have considered and approved the providing of a permanent roof over the south, east and west sides of the outer terrace of the Roman Promenade. Detailed plans have been submitted by Mr. A. J. Taylor, the cost of the scheme being estimated at £3,750. The Council recommended the Baths Committee to obtain tenders, and the Town Clerk to apply to the M.H. for sanction to borrow a sum of £3,750.—The Council has recommended the Engineer to remove the Bath pavilion from Wembley Exhibition and re-erect it in the Royal Victoria Park, Botanic Gardens, at a cost of about £715.—The City Engineer reported that the estimated cost of providing necessary fencing, gates, approach and drainage of surface water at Larkhall playground at £700, and the T.C. resolved that the engineer be authorised to put the work in hand.

BEVERLEY.—The T.C. has decided to erect new public lavatories on the site in a narrow street off the Market-place known as Dyer-lane.

BEXHILL.—The T.C. has approved a scheme for the erection of a bridge over the railway opposite Manor-road, and recommended application be made to the M.H. for sanction to borrow £8,051.

BAYTH.—The T.C. decided to proceed with the proposed bathing pool. Sanction is to be sought from the Ministry for a loan of £10,000.

BRADFORD.—The E.C. has adopted plans prepared by the City Architect for the establishment of a boys' department at the Margaret Macmillan School at Thackley. The estimated cost of the complete scheme is £13,118.

BRISTOL.—The E.C. recommend the borrowing of £785 13s. for the purpose of erecting a handicraft centre at Wick-road Council school.

BROMLEY.—The M.H. has held an inquiry into the application of the R.D.C. for sanction to a loan to meet the cost of building offices and of providing a depot at Orpington, on a site acquired on the west side of the railway station.

BURY.—The Corporation Baths Committee recommended the extension of bathing facilities and the provision of washhouses at the old Militia Barracks in Bolton-road, Elton, and suggest that the borough engineer should prepare sketch plans, including provision for the accommodation of spectators at galas.

CARSHALTON.—The U.D.C. passed plans: Thirty-eight houses in Milton-avenue and eight houses in Westmead-road, for Edser & Brown.

CESTER.—The T.C. recommend that application be made to the M.H. for sanction to borrow £2,841, for the erection of houses on the Bottoms-lane site.—The City Surveyor has been instructed to prepare a design and estimate for the cost of providing suitable shelters.—The T.C. has received the sanction of the M.H. to the borrowing of £637 for purchase of Cherry-grove site. The City Surveyor has interviewed the M.H. on the proposal for the erection of 16 houses on this site.—The Council has referred to the Slaughter-house Sub-Committee to consider and report upon the question of providing additional lairage accommodation at the Public Abattoir.

DEPWADE.—The R.D.C. recommended that the following houses be erected: Bunwell 4, Earsham 4, Fundenhall 2, Hapton 2, Harleston 8, Scole 4, Stratton St. Mary 4, Stratton St. Michael 4, Tibenham Long Row 4, Dickleburgh 4, and Hempsall 4.

DONCASTER.—The Corporation Housing Committee has decided to erect a further 136 houses on the Woodfield-lane housing site—36 parlour type and 100 non-parlour type.

DUBLIN.—The Engineering Inspector of the Ministry of Local Government will conduct an inquiry regarding the City Commissioners' proposal to borrow £120,000 for the purpose of improving the water supply to the North side of the city and providing additional filtration at Roundwood.—Authority has been given to the City Commissioners to borrow £84,000 for carrying out main drainage works.—The Government has approved of the City Commissioners' proposal to utilise the site of the Linenhall Barracks for a housing scheme.

EPSOM.—The R.D.C. has given directions for tenders for the erection of 20 houses at Tadworth.

GLASGOW.—Funds are being raised for the new Central Synagogue.

GODSTONE.—The R.D.C. has received permission from the M.H. for the erection of 100 additional houses.

HINCKLEY.—The R.D.C. has decided to erect the first 50 houses under the Council's new scheme in the following districts: Barwell 10, Earl Shilton 10, Burbage 6, Stoney Stanton 6, Sharnford 6, Higham-on-the Hill 4, Sapcote 4, and Stoke Golding 4.

LARNE.—The U.D.C. are seeking sanction to a scheme for making a new street, clearing old cottages, and erecting twenty new houses at a cost of £350 each.

LEEDS.—A £70,000 scheme for the construction of new settlement tanks at the sewage works at Thorpe Stapleton has been approved by the Corporation General Purposes Committee. Application is to be made to the M.H.—The Improvements Committee of the Corporation has approved a proposal for the widening of a portion of Smithy Mills-lane, Weetwood, and the construction thereof of a new bridge.

LONDON (BOW).—The L.C.C. recommend the erection of a school for 640 children at a cost of £29,661, in Wellington-road.

LONDON (BRIXTON).—The L.C.C. recommend that the preliminary plans for the erection of a central school on the Holland-road site be approved, and that the approval of the B.E. be sought thereto, and that the architect be instructed to proceed with the preparation of working drawings, specifications and quantities. The school is estimated to cost £25,022.

LONDON (HACKNEY).—The L.C.C. Education Committee recommend the provision of a store-room, at the Institute, at a cost of £228.

LONDON (HAMMERSMITH).—The L.C.C. recommend that the preliminary plans for the erection of an elementary school on the Lena Gardens site be approved; that the approval of the B.E. be sought, and the architect be instructed to proceed with the preparation of working drawings, specifications, quantities. The expenditure will be £24,369.

LONDON (ISLINGTON).—The L.C.C. recommend that the preliminary plans for the provision of a secondary school for 450 girls at Highbury Hill be approved, and that the approval of the B.E. be sought, and the architect be instructed to proceed with the preparation of working drawings, specifications and quantities. The estimated cost is £46,704.

LONDON (KENNINGTON).—The L.C.C. recommend that the preliminary plans for rebuilding the Springfield school be approved, and that the approval of the B.E. be sought. The school will cost £37,431.

LONDON (LEWISHAM).—The L.C.C. recommend that the preliminary plans for the enlargement of the Elfrida school and the provision of handicraft and domestic economy accommodation be approved, and that the approval of the B.E. be sought thereto. The school will cost £7,453.

LONDON (NORWOOD).—The L.C.C. recommend that the preliminary plans for the erection of a central school on the Carnac-street site (Norwood) be approved, and that the approval of the B.E. be sought. The estimated cost is £24,644.

LONDON (ST. PANCRAS).—The B.C. has appointed a special Sub-Committee to review certain housing schemes for any suitable sites in the Borough upon which working-class dwellings can be erected.—The B.C. recommend that application be made to the Electricity Commissioners for sanction to the borrowing of the sum of £27,615 for electricity purposes.

LONDON (STEPNEY).—The L.C.C. recommend the borrowing by the B.C. of an amount not exceeding £6,300 for housing purposes.

LONDON (STOKE NEWINGTON).—The L.C.C. recommend that the preliminary plans for the erection of a central school on the Albion-road site be approved, and that the approval of the B.E. be sought. The cost of the school will be £24,038.

LONDON (WANDSWORTH).—The L.C.C. recommend that, subject to the approval of the M.H., Whitby House, with accommodation for 348 persons, on the East Hill estate, be appropriated as part of the re-

housing accommodation required to be provided under the Hickman's Folly scheme.

LONDON (WESTMINSTER).—The City Council recommended undertaking the necessary diversion of gullies and sewers in connection with the construction of the new underground railway station in Piccadilly Circus.

LONDON (WOOLWICH).—The B.C. are inviting tenders for a new small bacteriological laboratory at their infirmary.

LURGAN.—The R.D.C. has received approval of the proposal to borrow £2,500 for completing labourers' cottages.

MANCHESTER.—The 1927 National Eisteddfod Pavilion Committee has selected as a site for the pavilion the playground of the Holyhead County School.

MANSFIELD.—The T.C. passed plans: H. Bagdaley, ten houses, Berry Hill-lane; H. Ashley, eight houses, Perlethorpe-avenue.

NAVAN.—The Meath C.C. are to seek a loan of £2,000 for completion of reconstruction of County Hospital.

NEWCASTLE.—The B.G. are to construct a subway underneath Westgate-road connecting the new nurses' home now in erection with the Wingrove Hospital. Plans are in preparation for the L.N.E.R. bridge, which is to be constructed by the railway company.

NEWCASTLE (CO. DOW).—The U.D.C. is considering a scheme for the provision of hot water baths, &c., at Blackrock, at a cost of £4,731.

NORTH TIPPERARY.—The Board of Health proposes to borrow £1,500 for the construction of five labourers' cottages in Thurles.

NORTHAMPTON.—The M.H. has sanctioned the borrowing of £3,470, being the cost of the revised scheme for the development of the western end of the Racecourse, including the erection of an attendant's house, conveniences, and tool shed.

NOTTINGHAM.—About another £7,000 is wanted for the erection of the new hospital for women in Peel-street, Nottingham, which is to take the place of the existing institutions in Raleigh-street and Castle-gate.

OMAGH.—The U.D.C. is to erect four blocks of semi-detached houses on the Dublin road at a cost of £680 each.

OXFORD.—The T.C. are to alter the municipal offices, at a cost of £1,000.—The Deputy City Engineer submitted amended lay-outs for the Weirs-lane South site and the Abingdon-road Glebe site, and the T.C. recommended that the lay-outs of both sites be approved and submitted to the M.H. for approval.—Application is to be made to the M.H. for sanction to loans of £6,935 10s. for the lay-out of the Weirs-lane South site, and £32,414 10s. for the erection of seventy-six houses; also to loans of £4,460 for the lay-out of the Abingdon-road Glebe site, and £28,120 for the erection of sixty houses.

PEMBROKE.—The U.D.C. has decided to build 300 more houses on sites about to be acquired.

ROMSEY.—The R.D.C. has approved the scheme of the reconstruction of the bridge spanning the Test at Mottisfont.

SHEFFIELD.—The Carver-street Chapel Trustees have asked permission to erect new buildings on the site at the corner of West-street and Rockingham street.—The plans prepared by W. J. Hale, F.R.I.B.A., include six shops with basements with a large room, and smaller ones on the first floor for girls' work, and similar rooms above for work amongst men; also a new chapel-keeper's house. The whole scheme is to cost about £12,000.

SOUTHEND-ON-SEA.—The C.B. recommend that application be made to the M.H. for sanction to the raising of a loan of £3,500 for the construction of men's and women's conveniences in the plantation on the Chalkwell Esplanade immediately west of Chalkwell-avenue.

—The C.B. passed plans: Twenty-four houses, new road off Sutton-road, for the Southend-on-Sea Master Builders' Association; ten shops and warehouse, Holly-gardens, Southchurch-road, for D. E. Kerridge; four houses, two shops, twelve flats, and fifteen garages, Hildaville-drive and Fairfax-drive, for T. J. Dennis; eight houses and garages, Tyrone-road, for W. L. Allen.

SWANSEA.—The C.B. resolved that the Borough Architect proceed with the preparation of the bills of quantities for the proposed first block of new buildings at the Technical College. Plans have been provisionally approved by the B.E.—The Director of the municipal schools has received sanction from the M.H. to borrow the sum required for the cost of improving the Boys' School and erecting a new school for girls.—The Borough Architect is to prepare plans for erecting a house for the caretaker in the school grounds at a cost of £600 to £650, on the site of a stable and yard at the Intermediate Girls' School.—The C.B. resolved that the Housing Committee be requested to apply to the Ministry for a further grant in connection with 200 houses.—The Council resolved that the scheme for widening Mayals-road be approved, and that the Town Clerk be instructed to make application to the M.H. for sanction to the borrowing of £35,540 for the work.—The Council resolved that (a) public convenience be made in next year's estimates for (a) public convenience for men and women near the "Star Inn"; (b) a four-stall urinal in Bethel-road; (c) a four-stall urinal at Peniel Green.—The Committee has considered the question of additional accommodation for maternity beds, and resolved that the Borough Estate Agent be authorised to continue negotiations for alternative accommodation.—The C.B. resolved that the Borough Architect proceed with the wiring of Manselton and Terrace-road schools, at the approximate cost of £420.—Plans passed: Mission hall, Wychtree-street, for J. R. Davies; church and hall, Clarence-terrace, for the Swansea Parochial Church Council; 26 houses (9 in Tynmawr-street, 7 in Gelli-street, and 10 in Grafog-street, Danygraig), for J. Pye.

WEYBRIDGE.—The Housing Committee of the U.D.C. resolved that Mr. L. De Soissons, architect, be invited to attend the committee with a view to submitting a scheme for the erection of additional houses by the Council at Old Palace Gardens.

YORK.—Messrs. H. Colman & Sons have prepared a scheme for the lay-out and erection of houses at Water End, Clifton, York.

NEW BUILDINGS IN SCOTLAND

Arbroath.—BUILDINGS.—The Forfarshire E.C. are considering the question of accommodation in the Arbroath High School, and plans have been prepared of new buildings proposed to be used for the accommodation of the elementary department.

Falkirk.—EXTENSION.—Funds are being

raised for the extension to the Falkirk and District Infirmary.

Perthshire.—HOUSES.—Seventy-four houses are being erected in Perthshire by the D.C. The houses to be erected are as follows:—Central District, Comrie, 10 houses of bungalow type, estimated cost £4,648; Muthill, eight houses of bungalow type; Highland District, Blair Atholl, six houses of Atholl steel type, estimated cost £3,228; Pitlochry, 12 houses of Atholl steel type, estimated cost £6,900.

Tranent.—SCHOOL.—The Master of Works for the E.C. has been instructed to complete plans and secure estimates for the erection of a new infants' school at Tranent.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to November 30, 1925:—

	Completed.	Under Construction
1919 Act	25,251 ..	289
Private Subsidy Schemes	2,324 ..	—
Slum Clearance Schemes	2,103 ..	3,088
1923 Act	5,291 ..	5,738
1924 Act (Local Authority Scheme)	409 ..	4,093
	35,378 ..	13,208

Of the total number of houses completed and under construction under the 1923 Act, 3,472 are by the Local Authorities and 7,557 by private enterprise.

In Edinburgh houses are being built with the steel roof of the design devised by Colonel Peter Nissen, D.S.O., the inventor of the Nissen hut. These houses have an attractive frontage, and the demonstration pair which are not yet completed have already been sold at £570 each complete. Those responsible for deciding to proceed with these houses are finding that there is no shortage of skilled labour, contrary to what is experienced in many parts of England. It is said that there is ample supply of bricklayers, builders, joiners, and plumbers, and also a fair supply of plasterers. Skilled tradesmen who have not been unemployed for years are now asking for work, and it is thought that next year there will be an even more ample supply of skilled building labour in the south-east of Scotland.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

PATENTS.

APPLICATIONS PUBLISHED.*

213,572.—I. Tcherniakofsky and H. R. J. Sawyer: Hot water heating installations.

240,208.—F. J. Commin and A. Wilson.

Hughes: Roofing materials and lining-boards.

240,250.—H. B. Haycock: Picture-hanging rails.

240,257.—U. Fiorenzi: Methods of making building-blocks.

240,261.—W. Buck and E. Buck: Construc-tion of walls and blocks for building the same.

240,276.—L. Parsons and H. M. Parsons: Trivets for domestic firegrates of a barless type.

240,277.—R. H. Youngman: Neutral cement.

240,295.—J. P. Petty: Production of hollow bodies of concrete.

240,317.—Moir Buchanan Centrifugal Processes, Ltd., and R. A. Whitson: Pipe joint for concrete pipes.

240,333.—W. E. Farrer: Device for sup-porting flat objects vertically against walls.

240,352.—G. E. Wight: Apparatus for applying mortar in brick laying.

240,366.—A. G. Helbig: Furnace walls.

240,376.—J. H. Doble and W. T. Appleton: Shuttering arrangements for casting concrete walls in situ.

240,386.—C. H. Carey: Processes and com-positions for the treatment of cement and con-crete.

240,552.—F. Griffiths and B. Cromwell: Building constructions.

240,561.—C. D. Burney: Manufacture of reinforced building or constructional materials or elements.

240,633.—A. Gibb: Method of and means for dividing blocks of stone.

240,648.—H. L. Sleigh, A. S. Cheston, and E. C. Edmonds: Door latches.

240,657.—E. H. H. Vertigan: Floors for buildings.

240,676.—G. Martin: Building construction.

226,553.—V. A. Perlat: Door and like clos-ing and fastening devices.

240,705.—C. Bott: Walls and roofs.

240,719.—A. R. Prior and R. I. Hargreaves: Concrete cavity-blocks and apparatus for their manufacture.

240,742.—H. Nadge (Firm of): Manufac-ture of building blocks.

240,761.—C. Hutchins and J. R. Morriss: Collapsible cores for concrete wall construc-tion.

216,855.—G. B. Williams: Means for moulding T-shaped slabs.

216,856.—G. B. Williams: Hollow-wall con-struction.

238,948.—C. D. Burney: Construction of buildings, dwelling houses, and similar struc-tures.

238,949.—F. Mulligan: Manufacture of hydraulic cement or plaster from gypsum.

238,953.—F. Pichler: Construction of con-tainer walls subject to external pressure.

238,982.—F. Mulligan: Paints and washes.

238,996.—F. W. Gough: Damp-proof course for buildings.

239,092.—D. G. Underdown: Construction of reinforced concrete slab walls.

239,262.—T. Long and S. Elgar: Door and furniture handles.

216,892.—L. Rott: Fire and burglar-proof doors and door-jambs of reinforced concrete.

239,276.—E. Pilkington: Composition for staining and filling mahogany.

239,282.—H. D. Cook and G. H. Lundgren. Pipe joints and connections.

239,288.—Crittall Manufacturing Co., Ltd., and R. W. Prior: Mechanism for opening and closing casement windows.

217,605.—S. Seailles (née Calogeropoulos): Process for producing polished surface in cement.

239,337.—J. Pickersgill: Concrete kerb-stones.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.
